(54) Title: ANTISENSE MODULATION OF B7 PROTEIN EXPRESSION

(57) Abstract: Compositions and methods for the diagnosis, prevention and treatment of immune states and disorders amenable to treatment through modulation of T cell activation are provided. In accordance with preferred embodiments, oligonucleotides are provided which are specifically hybridizable with nucleic acids encoding B7 proteins.

ANTISENSE MODULATION OF B7 PROTEIN EXPRESSION

CROSS-REFERENCE TO RELATED APPLICATIONS

- 5 This is a continuation-in-part of U.S. Application Serial No. 09/326,186, filed June 4, 1999, which is a continuation-in-part of U.S. Application Serial No. 08/777,266, filed December 31, 1996.

FIELD OF THE INVENTION

- 10 This invention relates to diagnostics, research reagents and therapeutics for disease states which respond to modulation of T cell activation. In particular, this invention relates to antisense oligonucleotide interactions with certain messenger ribonucleic acids (mRNAs) or DNAs
15 involved in the synthesis of proteins that modulate T cell activation. Antisense oligonucleotides designed to hybridize to nucleic acids encoding B7 proteins are provided. These oligonucleotides have been found to lead to the modulation of the activity of the RNA or DNA, and
20 thus to the modulation of T cell activation. Palliative, therapeutic and prophylactic effects result.

BACKGROUND OF THE INVENTION

- Inflammation is a localized protective response mounted by tissues in response to injury, infection, or
25 tissue destruction resulting in the destruction of the infectious or injurious agent and isolation of the injured tissue. A typical inflammatory response proceeds as follows: recognition of an antigen as foreign or recognition of tissue damage, synthesis and release of
30 soluble inflammatory mediators, recruitment of inflammatory cells to the site of infection or tissue damage, destruction and removal of the invading organism or damaged tissue, and deactivation of the system once the invading organism or damage has been resolved. In many human

-2-

diseases with an inflammatory component, the normal, homeostatic mechanisms which attenuate the inflammatory responses are defective, resulting in damage and destruction of normal tissue.

5 Cell-cell interactions are involved in the activation of the immune response at each of the stages described above. One of the earliest detectable events in a normal inflammatory response is adhesion of leukocytes to the vascular endothelium, followed by migration of leukocytes
10 out of the vasculature to the site of infection or injury. In general, the first inflammatory cells to appear at the site of inflammation are neutrophils, followed by monocytes and lymphocytes. Cell-cell interactions are also critical for activation of both B-lymphocytes (B cells) and T-
15 lymphocytes (T cells) with resulting enhanced humoral and cellular immune responses, respectively.

The hallmark of the immune system is its ability to distinguish between self (host) and nonself (foreign invaders). This remarkable specificity exhibited by the
20 immune system is mediated primarily by T cells. T cells participate in the host's defense against infection but also mediate organ damage of transplanted tissues and contribute to cell attack in graft-versus-host disease (GVHD) and some autoimmune diseases. In order to induce an
25 antigen-specific immune response, a T cell must receive signals delivered by an antigen-presenting cell (APC). T cell-APC interactions can be divided into three stages: cellular adhesion, T cell receptor (TCR) recognition, and costimulation. At least two discrete signals are required
30 from an APC for induction of T cell activation. The first signal is antigen-specific and is provided when the TCR interacts with an antigen in the context of a major histocompatibility complex (MHC) protein, or an MHC-related CD1 protein, expressed on the surface of an APC ("CD,"
35 standing for "cluster of differentiation," is a term used

-3-

to denote different T cell surface molecules). The second (costimulatory) signal involves the interaction of the T cell surface antigen, CD28, with its ligand on the APC, which is a member of the B7 family of proteins.

- 5 CD28, a disulfide-linked homodimer of a 44 kilodalton polypeptide and a member of the immunoglobulin superfamily, is one of the major costimulatory signal receptors on the surface of a resting T cell for T cell activation and cytokine production (Allison, *Curr. Opin. Immunol.*, 1994, 6, 414; Linsley and Ledbetter, *Annu. Rev. Immunol.*, 1993, 11, 191; June et al., *Immunol. Today*, 1994, 15, 321). Signal transduction through CD28 acts synergistically with TCR signal transduction to augment both interleukin-2 (IL-2) production and proliferation of naive T cells. B7-1 (also known as CD80) was the first ligand identified for CD28 (Liu and Linsley, *Curr. Opin. Immunol.*, 1992, 4, 265). B7-1 is normally expressed at low levels on APCs, however, it is upregulated following activation by cytokines or ligation of cell surface molecules such as CD40 (Lenschow et al., *Proc. Natl. Acad. Sci. U.S.A.*, 1993, 90, 11054; Nabavi et al., *Nature*, 1992, 360, 266). Initial studies suggested that B7-1 was the CD28 ligand that mediated costimulation (Reiser et al., *Proc. Natl. Acad. Sci. U.S.A.*, 1992, 89, 271; Wu et al., *J. Exp. Med.*, 1993, 178, 1789; Harlan et al., *Proc. Natl. Acad. Sci. U.S.A.*, 1994, 91, 3137). However, the subsequent demonstration that anti-B7-1 monoclonal antibodies (mAbs) had minimal effects on primary mixed lymphocyte reactions and that B7-1-deficient mice responded normally to antigens (Lenschow et al., *Proc. Natl. Acad. Sci. U.S.A.*, 1993, 90, 11054; Freeman et al., *Science*, 1993, 262, 909) resulted in the discovery of a second ligand for the CD28 receptor, B7-2 (also known as CD86). In contrast with anti-B7-1 mAbs, anti-B7-2 mAbs are potent inhibitors of T cell

-4-

proliferation and cytokine production (Wu et al., *J. Exp. Med.*, 1993, 178, 1789; Chen et al., *J. Immunol.*, 1994, 152, 2105; Lenschow et al., *Proc. Natl. Acad. Sci. U.S.A.*, 1993, 90, 11054). B7:CD28 signaling may be a necessary component
5 of other T cell costimulatory pathways, such as CD40:CD40L (CD40 ligand) signaling (Yang et al., *Science*, 1996, 273, 1862).

In addition to binding CD28, B7-1 and B7-2 bind the cytolytic T-lymphocyte associated protein CTLA4. CTLA4 is
10 a protein that is structurally related to CD28 but is expressed on T cells only after activation (Linsley et al., *J. Exp. Med.*, 1991, 174, 561). A soluble recombinant form of CTLA4, CTLA4-Ig, has been determined to be a more efficient inhibitor of the B7:CD28 interaction than
15 monoclonal antibodies directed against CD28 or a B7 protein. In vivo treatment with CTLA4-Ig results in the inhibition of antibody formation to sheep red blood cells or soluble antigen (Linsley et al., *Science*, 1992, 257, 792), prolongation of cardiac allograft and pancreatic
20 islet xenograft survival (Lin et al., *J. Exp. Med.*, 1993, 178, 1801; Lenschow et al., 1992, *Science*, 257, 789; Lenschow et al., *Curr. Opin. Immunol.*, 1991, 9, 243), and significant suppression of immune responses in GVHD (Hakim et al., *J. Immun.*, 1995, 155, 1760). It has been proposed
25 that CD28 and CTLA4, although both acting through common B7 receptors, serve opposing costimulatory and inhibitory functions, respectively (Allison et al., *Science*, 1995, 270, 932). CTLA4Ig, which binds both B7-1 and B7-2 molecules on antigen-presenting cells, has been shown to
30 block T-cell costimulation in patients with stable psoriasis vulgaris, and to cause a 50% or greater sustained improvement in clinical disease activity in 46% of the patients to which it was administered. This result was

-5-

dose-dependent. Abrams et al., *J. Clin. Invest.*, 1999, 9, 1243-1225.

European Patent Application No. EP 0 600 591, published June 8, 1994 (A2), discloses a method of
5 inhibiting tumor cell growth in which tumor cells from a patient are recombinantly engineered *ex vivo* to express a B7-1 protein and then reintroduced into a patient. As a result, an immunologic response is stimulated against both B7-transfected and nontransfected tumor cells.

10 International Publication No. WO 95/03408, published February 2, 1995, discloses nucleic acids encoding novel CTLA4/CD28 ligands which costimulate T cell activation, including B7-2 proteins. Also disclosed are antibodies to B7-2 proteins and methods of producing B7-2 proteins.

15 International Publication No. WO 95/05464, published February 23, 1995, discloses a polypeptide, other than B7-1, that binds to CTLA4, CD28 or CTLA4-Ig. Also disclosed are methods for obtaining a nucleic acid encoding such a polypeptide.

20 International Publication No. WO 95/06738, published March 9, 1995, discloses nucleic acids encoding B7-2 (also known as B70) proteins. Also disclosed are antibodies to B7-2 proteins and methods of producing B7-2 proteins.

European Patent Application No. EP 0 643 077,
25 published March 15, 1995 (A1), discloses a monoclonal antibody which specifically binds a B7-2 (also known as B70) protein. Also disclosed are methods of producing monoclonal antibodies which specifically bind a B7-2 protein.

30 U.S. Patent No. 5,434,131, issued July 18, 1995, discloses the CTLA4 protein as a ligand for B7 proteins. Also disclosed are methods of producing CTLA4 fusion proteins (e.g., CTLA4-Ig) and methods of regulating immune responses using antibodies to B7 proteins or CTLA4
35 proteins.

-6-

International Publication No. WO 95/22619, published August 24, 1995, discloses antibodies specific to B7-1 proteins which do not bind to B7-2 proteins. Also disclosed are methods of regulating immune responses using
5 antibodies to B7-1 proteins.

International Publication No. WO 95/34320, published December 21, 1995, discloses methods for inhibiting T cell responses using a first agent which inhibits a costimulatory agent, such as an CTLA4-Ig fusion protein,
10 and a second agent which inhibits cellular adhesion, such as an anti-LFA-1 antibody. Such methods are indicated to be particularly useful for inhibiting the rejection of transplanted tissues or organs.

International Publication No. WO 95/32734, published
15 December 7, 1995, discloses FcγRII bridging agents which either prevent the upregulation of B7 molecules or impair the expression of ICAM-3 on antigen presenting cells. Such FcγRII bridging agents include proteins such as aggregated human IgG molecules or aggregated Fc fragments of human IgG
20 molecules.

International Publication No. WO 96/11279, published April 18, 1996 (A2) and May 17, 1996 (A3), discloses recombinant viruses comprising genetic sequences encoding
(1) one or more immunostimulatory agents, including B7-1
25 and B7-2, and (2) and antigens from a disease causing agent. Also disclosed are methods of treating diseases using such recombinant viruses.

To date, there are no known therapeutic agents which effectively regulate and prevent the expression of B7
30 proteins such as B7-1 and B7-2. Thus, there is a long-felt need for compounds and methods which effectively modulate critical costimulatory molecules such as the B7 proteins. It is anticipated that oligonucleotides capable of modulating the expression of B7 proteins provide for a
35 novel therapeutic class of anti-inflammatory agents with

-7-

activity towards a variety of inflammatory or autoimmune diseases, or disorders or diseases with an inflammatory component such as asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, lupus erythematosus, systemic lupus erythematosus, diabetes, multiple sclerosis, contact dermatitis, rhinitis and various allergies. In addition, oligonucleotides capable of modulating the expression of B7 proteins would provide a novel means of manipulating the ex vivo proliferation of T cells.

SUMMARY OF THE INVENTION

In accordance with the present invention, oligonucleotides are provided which specifically hybridize with nucleic acids encoding B7-1 or B7-2. Certain oligonucleotides of the invention are designed to bind either directly to mRNA transcribed from, or to a selected DNA portion of, the B7-1 or B7-2 gene, thereby modulating the amount of protein translated from a B7-1 or B7-2 mRNA or the amount of mRNA transcribed from a B7-1 or B7-2 gene, respectively.

Oligonucleotides may comprise nucleotide sequences sufficient in identity and number to effect specific hybridization with a particular nucleic acid. Such oligonucleotides are commonly described as "antisense." Antisense oligonucleotides are commonly used as research reagents, diagnostic aids, and therapeutic agents.

It has been discovered that the B7-1 and B7-2 genes, encoding B7-1 and B7-2 proteins, respectively, are particularly amenable to this approach. As a consequence of the association between B7 expression and T cell activation and proliferation, inhibition of the expression of B7-1 or B7-2 leads to inhibition of the synthesis of B7-1 or B7-2, respectively, and thereby inhibition of T cell activation and proliferation. Additionally, the

-8-

oligonucleotides of the invention may be used to inhibit the expression of one of several alternatively spliced mRNAs of a B7 transcript, resulting in the enhanced expression of other alternatively spliced B7 mRNAs. Such modulation is desirable for treating various inflammatory or autoimmune disorders or diseases, or disorders or diseases with an inflammatory component such as asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, lupus erythematosus, systemic lupus erythematosus, diabetes, multiple sclerosis, contact dermatitis, rhinitis, various allergies, and cancers and their metastases. Such modulation is further desirable for preventing or modulating the development of such diseases or disorders in an animal suspected of being, or known to be, prone to such diseases or disorders. The invention also relates to pharmaceutical compositions which comprise an antisense oligonucleotide to a B7 protein in combination with a second anti-inflammatory agent, such as a second antisense oligonucleotide to a protein which mediates intercellular interactions, e.g., an intercellular adhesion molecule (ICAM) protein.

Methods comprising contacting animals with oligonucleotides specifically hybridizable with nucleic acids encoding B7 proteins are herein provided. These methods are useful as tools, for example, in the detection and determination of the role of B7 protein expression in various cell functions and physiological processes and conditions, and for the diagnosis of conditions associated with such expression. Such methods can be used to detect the expression of B7 genes (i.e., B7-1 or B7-2) and are thus believed to be useful both therapeutically and diagnostically. Methods of modulating the expression of B7 proteins comprising contacting animals with

-9-

oligonucleotides specifically hybridizable with a B7 gene are herein provided. These methods are believed to be useful both therapeutically and diagnostically as a consequence of the association between B7 expression and T cell activation and proliferation. The present invention also comprises methods of inhibiting B7-associated activation of T cells using the oligonucleotides of the invention. Methods of treating conditions in which abnormal or excessive T cell activation and proliferation occurs are also provided. These methods employ the oligonucleotides of the invention and are believed to be useful both therapeutically and as clinical research and diagnostic tools. The oligonucleotides of the present invention may also be used for research purposes. Thus, the specific hybridization exhibited by the oligonucleotides of the present invention may be used for assays, purifications, cellular product preparations and in other methodologies which may be appreciated by persons of ordinary skill in the art.

The methods disclosed herein are also useful, for example, as clinical research tools in the detection and determination of the role of B7-1 or B7-2 expression in various immune system functions and physiological processes and conditions, and for the diagnosis of conditions associated with their expression. The specific hybridization exhibited by the oligonucleotides of the present invention may be used for assays, purifications, cellular product preparations and in other methodologies which may be appreciated by persons of ordinary skill in the art. For example, because the oligonucleotides of this invention specifically hybridize to nucleic acids encoding B7 proteins, sandwich and other assays can easily be constructed to exploit this fact. Detection of specific hybridization of an oligonucleotide of the invention with a nucleic acid encoding a B7 protein present in a sample can

-10-

5 routinely be accomplished. Such detection may include detectably labeling an oligonucleotide of the invention by enzyme conjugation, radiolabeling or any other suitable detection system. A number of assays may be formulated employing the present invention, which assays will commonly comprise contacting a tissue or cell sample with a detectably labeled oligonucleotide of the present invention under conditions selected to permit hybridization and measuring such hybridization by detection of the label, as
10 is appreciated by those of ordinary skill in the art.

20 DETAILED DESCRIPTION OF THE INVENTION

The present invention employs oligonucleotides for use in antisense inhibition of the function of RNA and DNA encoding B7 proteins including B7-1 and B7-2. The present invention also employs oligonucleotides which are designed
25 to be specifically hybridizable to DNA or messenger RNA (mRNA) encoding such proteins and ultimately to modulate the amount of such proteins transcribed from their respective genes. Such hybridization with mRNA interferes with the normal role of mRNA and causes a modulation of its
30 function in cells. The functions of mRNA to be interfered with include all vital functions such as translocation of the RNA to the site for protein translation, actual translation of protein from the RNA, splicing of the RNA to yield one or more mRNA species, and possibly even
35 independent catalytic activity which may be engaged in by

-12-

the RNA. The overall effect of such interference with mRNA function is modulation of the expression of a B7 protein, wherein "modulation" means either an increase (stimulation) or a decrease (inhibition) in the expression of a B7
5 protein. In the context of the present invention, inhibition is the preferred form of modulation of gene expression.

Oligonucleotides may comprise nucleotide sequences sufficient in identity and number to effect specific
10 hybridization with a particular nucleic acid. Such oligonucleotides which specifically hybridize to a portion of the sense strand of a gene are commonly described as "antisense." Antisense oligonucleotides are commonly used as research reagents, diagnostic aids, and therapeutic
15 agents. For example, antisense oligonucleotides, which are able to inhibit gene expression with exquisite specificity, are often used by those of ordinary skill to elucidate the function of particular genes, for example to distinguish between the functions of various members of a biological
20 pathway. This specific inhibitory effect has, therefore, been harnessed by those skilled in the art for research uses.

The specificity and sensitivity of oligonucleotides is also harnessed by those of skill in the art for therapeutic
25 uses. For example, the following U.S. patents demonstrate palliative, therapeutic and other methods utilizing antisense oligonucleotides. U. S. Patent 5,135,917 provides antisense oligonucleotides that inhibit human interleukin-1 receptor expression. U.S. Patent 5,098,890
30 is directed to antisense oligonucleotides complementary to the *c-myc* oncogene and antisense oligonucleotide therapies for certain cancerous conditions. U.S. Patent 5,087,617 provides methods for treating cancer patients with antisense oligonucleotides. U.S. Patent 5,166,195 provides
35 oligonucleotide inhibitors of HIV. U.S. Patent 5,004,810

-13-

provides oligomers capable of hybridizing to herpes simplex virus Vmw65 mRNA and inhibiting replication. U.S. Patent 5,194,428 provides antisense oligonucleotides having antiviral activity against influenza virus. U.S. Patent 5 4,806,463 provides antisense oligonucleotides and methods using them to inhibit HTLV-III replication. U.S. Patent 5,286,717 provides oligonucleotides having a complementary base sequence to a portion of an oncogene. U.S. Patent 5,276,019 and U.S. Patent 5,264,423 are directed to 10 phosphorothioate oligonucleotide analogs used to prevent replication of foreign nucleic acids in cells. U.S. Patent 4,689,320 is directed to antisense oligonucleotides as antiviral agents specific to CMV. U.S. Patent 5,098,890 provides oligonucleotides complementary to at least a 15 portion of the mRNA transcript of the human *c-myc* gene. U.S. Patent 5,242,906 provides antisense oligonucleotides useful in the treatment of latent EBV infections.

It is preferred to target specific genes for antisense attack. "Targeting" an oligonucleotide to the associated 20 nucleic acid, in the context of this invention, is a multistep process. The process usually begins with the identification of a nucleic acid sequence whose function is to be modulated. This may be, for example, a cellular gene (or mRNA transcribed from the gene) whose expression is 25 associated with a particular disorder or disease state, or a foreign nucleic acid from an infectious agent. In the present invention, the target is a cellular gene associated with several immune system disorders and diseases (such as inflammation and autoimmune diseases), as well as with 30 ostensibly "normal" immune reactions (such as a host animal's rejection of transplanted tissue), for which modulation is desired in certain instances. The targeting process also includes determination of a region (or regions) within this gene for the oligonucleotide 35 interaction to occur such that the desired effect, either

-14-

detection or modulation of expression of the protein, will result. Once the target region have been identified, oligonucleotides are chosen which are sufficiently complementary to the target, i.e., hybridize sufficiently well and with sufficient specificity to give the desired effect.

Generally, there are five regions of a gene that may be targeted for antisense modulation: the 5' untranslated region (hereinafter, the "5'-UTR"), the translation initiation codon region (hereinafter, the "tIR"), the open reading frame (hereinafter, the "ORF"), the translation termination codon region (hereinafter, the "tTR") and the 3' untranslated region (hereinafter, the "3'-UTR"). As is known in the art, these regions are arranged in a typical messenger RNA molecule in the following order (left to right, 5' to 3'): 5'-UTR, tIR, ORF, tTR, 3'-UTR. As is known in the art, although some eukaryotic transcripts are directly translated, many ORFs contain one or more sequences, known as "introns," which are excised from a transcript before it is translated; the expressed (unexcised) portions of the ORF are referred to as "exons" (Alberts et al., *Molecular Biology of the Cell*, 1983, Garland Publishing Inc., New York, pp. 411-415). Furthermore, because many eukaryotic ORFs are a thousand nucleotides or more in length, it is often convenient to subdivide the ORF into, e.g., the 5' ORF region, the central ORF region, and the 3' ORF region. In some instances, an ORF contains one or more sites that may be targeted due to some functional significance *in vivo*. Examples of the latter types of sites include intragenic stem-loop structures (see, e.g., U.S. Patent No. 5,512,438) and, in unprocessed mRNA molecules, intron/exon splice sites. Within the context of the present invention, one preferred intragenic site is the region encompassing the translation initiation codon of the open reading frame

-15-

(ORF) of the gene. Because, as is known in the art, the translation initiation codon is typically 5'-AUG (in transcribed mRNA molecules; 5'-ATG in the corresponding DNA molecule), the translation initiation codon is also

5 referred to as the "AUG codon," the "start codon" or the "AUG start codon." A minority of genes have a translation initiation codon having the RNA sequence 5'-GUG, 5'-UUG or 5'-CUG, and 5'-AUA, 5'-ACG and 5'-CUG have been shown to function *in vivo*. Furthermore, 5'-UUU functions as a

10 translation initiation codon *in vitro* (Brigstock et al., *Growth Factors*, 1990, 4, 45; Gelbert et al., *Somat. Cell. Mol. Genet.*, 1990, 16, 173; Gold and Stormo, in: *Escherichia coli and Salmonella typhimurium: Cellular and Molecular Biology*, Vol. 2, 1987, Neidhardt et al., eds.,

15 American Society for Microbiology, Washington, D.C., p. 1303). Thus, the terms "translation initiation codon" and "start codon" can encompass many codon sequences, even though the initiator amino acid in each instance is typically methionine (in eukaryotes) or formylmethionine

20 (prokaryotes). It is also known in the art that eukaryotic and prokaryotic genes may have two or more alternative start codons, any one of which may be preferentially utilized for translation initiation in a particular cell type or tissue, or under a particular set of conditions, in

25 order to generate related polypeptides having different amino terminal sequences (Markussen et al., *Development*, 1995, 121, 3723; Gao et al., *Cancer Res.*, 1995, 55, 743; McDermott et al., *Gene*, 1992, 117, 193; Perri et al., *J. Biol. Chem.*, 1991, 266, 12536; French et al., *J. Virol.*,

30 1989, 63, 3270; Pushpa-Rekha et al., *J. Biol. Chem.*, 1995, 270, 26993; Monaco et al., *J. Biol. Chem.*, 1994, 269, 347; DeVirgilio et al., *Yeast*, 1992, 8, 1043; Kanagasundaram et al., *Biochim. Biophys. Acta*, 1992, 1171, 198; Olsen et al., *Mol. Endocrinol.*, 1991, 5, 1246; Saul et al., *Appl.*

-16-

Environ. Microbiol., 1990, 56, 3117; Yaoita et al., *Proc. Natl. Acad. Sci. USA*, 1990, 87, 7090; Rogers et al., *EMBO J.*, 1990, 9, 2273). In the context of the invention, "start codon" and "translation initiation codon" refer to
5 the codon or codons that are used in vivo to initiate translation of an mRNA molecule transcribed from a gene encoding a B7 protein, regardless of the sequence(s) of such codons. It is also known in the art that a translation termination codon (or "stop codon") of a gene
10 may have one of three sequences, i.e., 5'-UAA, 5'-UAG and 5'-UGA (the corresponding DNA sequences are 5'-TAA, 5'-TAG and 5'-TGA, respectively). The terms "start codon region" and "translation initiation region" refer to a portion of such an mRNA or gene that encompasses from about 25 to
15 about 50 contiguous nucleotides in either direction (i.e., 5' or 3') from a translation initiation codon. Similarly, the terms "stop codon region" and "translation termination region" refer to a portion of such an mRNA or gene that encompasses from about 25 to about 50 contiguous
20 nucleotides in either direction (i.e., 5' or 3') from a translation termination codon.

In the context of this invention, the term "oligonucleotide" refers to an oligomer or polymer of ribonucleic acid or deoxyribonucleic acid. This term
25 includes oligonucleotides composed of naturally-occurring nucleobases, sugars and covalent intersugar (backbone) linkages as well as oligonucleotides having non-naturally-occurring portions which function similarly. Such modified or substituted oligonucleotides are often preferred over
30 native forms because of desirable properties such as, for example, enhanced cellular uptake, enhanced binding to target and increased stability in the presence of nucleases.

Specific examples of some preferred modified
35 oligonucleotides envisioned for this invention include

-17-

those containing phosphorothioates, phosphotriesters, methyl phosphonates, short chain alkyl or cycloalkyl intersugar linkages or short chain heteroatomic or heterocyclic intersugar linkages. Most preferred are

5 oligonucleotides with phosphorothioates and those with $\text{CH}_2\text{-NH-O-CH}_2$, $\text{CH}_2\text{-N(CH}_3\text{)-O-CH}_2$ [known as a methylene(methylimino) or MMI backbone], $\text{CH}_2\text{-O-N(CH}_3\text{)-CH}_2$, $\text{CH}_2\text{-N(CH}_3\text{)-N(CH}_3\text{)-CH}_2$ and $\text{O-N(CH}_3\text{)-CH}_2\text{-CH}_2$ backbones, wherein the native phosphodiester backbone is represented as O-P-O-CH_2 . Also preferred are

10 oligonucleotides having morpholino backbone structures (Summerton and Weller, U.S. Patent 5,034,506). Further preferred are oligonucleotides with $\text{NR-C(*)-CH}_2\text{-CH}_2$, $\text{CH}_2\text{-NR-C(*)-CH}_2$, $\text{CH}_2\text{-CH}_2\text{-NR-C(*)}$, $\text{C(*)-NR-CH}_2\text{-CH}_2$ and $\text{CH}_2\text{-C(*)-NR-CH}_2$ backbones, wherein "*" represents O or S (known as amide

15 backbones; DeMesmaeker et al., WO 92/20823, published November 26, 1992). In other preferred embodiments, such as the peptide nucleic acid (PNA) backbone, the phosphodiester backbone of the oligonucleotide is replaced with a polyamide backbone, the nucleobases being bound

20 directly or indirectly to the aza nitrogen atoms of the polyamide backbone (Nielsen et al., *Science*, 1991, 254, 1497; U.S. Patent No. 5,539,082). Other preferred modified oligonucleotides may contain one or more substituted sugar moieties comprising one of the following at the 2'

25 position: OH, SH, SCH_3 , F, OCN, OCH_3OCH_3 , $\text{OCH}_3\text{O(CH}_2\text{)}_n\text{CH}_3$, $\text{O(CH}_2\text{)}_n\text{NH}_2$ or $\text{O(CH}_2\text{)}_n\text{CH}_3$ where n is from 1 to about 10; C_1 to C_{10} lower alkyl, alkoxyalkoxy, substituted lower alkyl, alkaryl or aralkyl; Cl; Br; CN; CF_3 ; OCF_3 ; O-, S-, or N-alkyl; O-, S-, or N-alkenyl; SOCH_3 ; SO_2CH_3 ; ONO_2 ; NO_2 ; N_3 ;

30 NH_2 ; heterocycloalkyl; heterocycloalkaryl; aminoalkylamino; polyalkylamino; substituted silyl; an RNA cleaving group; a reporter group; an intercalator; a group for improving the pharmacokinetic properties of an oligonucleotide; or a group for improving the pharmacodynamic properties of an

35 oligonucleotide and other substituents having similar

-18-

properties. A preferred modification includes 2'-methoxyethoxy (2'-O-CH₂CH₂OCH₃, also known as 2'-O-(2-methoxyethyl) or 2'-MOE) (Martin et al., *Helv. Chim. Acta*, 1995, 78, 486-504) i.e., an alkoxyalkoxy group. A further
5 preferred modification includes 2'-dimethylaminoethoxy, i.e., a O(CH₂)₂ON(CH₃)₂ group, also known as 2'-DMAOE, as described in examples hereinbelow, and
2'-dimethylamino-ethoxyethoxy (also known in the art as 2'-O-dimethyl-amino-ethoxy-ethyl or 2'-DMAEOE), i.e.,
10 2'-O-CH₂-O-CH₂-N(CH₃)₂, also described in examples hereinbelow. (Martin et al., *Helv. Chim. Acta*, 1995, 78, 486). Other preferred modifications include 2'-methoxy (2'-O-CH₃), 2'-propoxy (2'-OCH₂CH₂CH₃) and 2'-fluoro (2'-F). Similar modifications may also be made at other positions
15 on the oligonucleotide, particularly the 3' position of the sugar on the 3' terminal nucleotide and the 5' position of the 5' terminal nucleotide. Oligonucleotides may also have sugar mimetics such as cyclobutyls in place of the pentofuranosyl group.

20 The oligonucleotides of the invention may additionally or alternatively include nucleobase modifications or substitutions. As used herein, "unmodified" or "natural" nucleobases include adenine (A), guanine (G), thymine (T), cytosine (C) and uracil (U). Modified nucleobases include
25 nucleobases found only infrequently or transiently in natural nucleic acids, e.g., hypoxanthine, 6-methyladenine, 5-methylcytosine, 5-hydroxymethylcytosine (HMC), glycosyl HMC and gentiobiosyl HMC, as well synthetic nucleobases, e.g., 5-bromouracil, 5-hydroxymethyluracil, 8-azaguanine,
30 7-deazaguanine, N⁶(6-aminohexyl)adenine and 2,6-diaminopurine (Kornberg, A., *DNA Replication*, 1974, W.H. Freeman & Co., San Francisco, 1974, pp. 75-77; Gebeyehu, G., et al., *Nucleic Acids Res.*, 1987, 15, 4513).

Another preferred additional or alternative
35 modification of the oligonucleotides of the invention

-19-

involves chemically linking to the oligonucleotide one or more lipophilic moieties which enhance the cellular uptake of the oligonucleotide. Such lipophilic moieties may be linked to an oligonucleotide at several different positions

5 on the oligonucleotide. Some preferred positions include the 3' position of the sugar of the 3' terminal nucleotide, the 5' position of the sugar of the 5' terminal nucleotide, and the 2' position of the sugar of any nucleotide. The N⁶ position of a purine nucleobase may also be utilized to

10 link a lipophilic moiety to an oligonucleotide of the invention (Gebeyehu, G., et al., *Nucleic Acids Res.*, 1987, 15, 4513). Such lipophilic moieties include but are not limited to a cholesteryl moiety (Letsinger et al., *Proc. Natl. Acad. Sci. USA*, 1989, 86, 6553), cholic acid

15 (Manoharan et al., *Bioorg. Med. Chem. Lett.*, 1994, 4, 1053), a thioether, e.g., hexyl-S-tritylthiol (Manoharan et al., *Ann. N.Y. Acad. Sci.*, 1992, 660, 306; Manoharan et al., *Bioorg. Med. Chem. Lett.*, 1993, 3, 2765), a thiocholesterol (Oberhauser et al., *Nucl. Acids Res.*, 1992, 20, 533), an

20 aliphatic chain, e.g., dodecandiol or undecyl residues (Saison-Behmoaras et al., *EMBO J.*, 1991, 10, 111; Kabanov et al., *FEBS Lett.*, 1990, 259, 327; Svinarchuk et al., *Biochimie*, 1993, 75, 49), a phospholipid, e.g., di-hexadecyl-rac-glycerol or triethylammonium 1,2-di-O-

25 hexadecyl-rac-glycero-3-H-phosphonate (Manoharan et al., *Tetrahedron Lett.*, 1995, 36, 3651; Shea et al., *Nucl. Acids Res.*, 1990, 18, 3777), a polyamine or a polyethylene glycol chain (Manoharan et al., *Nucleosides & Nucleotides*, 1995, 14, 969), or adamantane acetic acid (Manoharan et al.,

30 *Tetrahedron Lett.*, 1995, 36, 3651), a palmityl moiety (Mishra et al., *Biochim. Biophys. Acta*, 1995, 1264, 229), or an octadecylamine or hexylamino-carbonyl-oxycholesterol moiety (Crooke et al., *J. Pharmacol. Exp. Ther.*, 1996, 277, 923). Oligonucleotides comprising lipophilic moieties, and

-20-

methods for preparing such oligonucleotides, as disclosed in U.S. Patents No. 5,138,045, No. 5,218,105 and No. 5,459,255, the contents of which are hereby incorporated by reference.

5 The present invention also includes oligonucleotides which are chimeric oligonucleotides. "Chimeric" oligonucleotides or "chimeras," in the context of this invention, are oligonucleotides which contain two or more chemically distinct regions, each made up of at least one
10 nucleotide. These oligonucleotides typically contain at least one region wherein the oligonucleotide is modified so as to confer upon the oligonucleotide increased resistance to nuclease degradation, increased cellular uptake, and/or increased binding affinity for the target nucleic acid. An
15 additional region of the oligonucleotide may serve as a substrate for enzymes capable of cleaving RNA:DNA or RNA:RNA hybrids. By way of example, RNase H is a cellular endonuclease which cleaves the RNA strand of an RNA:DNA duplex. Activation of RNase H, therefore, results in
20 cleavage of the RNA target, thereby greatly enhancing the efficiency of antisense inhibition of gene expression. Cleavage of the RNA target can be routinely detected by gel electrophoresis and, if necessary, associated nucleic acid hybridization techniques known in the art. By way of
25 example, such "chimeras" may be "gapmers," i.e., oligonucleotides in which a central portion (the "gap") of the oligonucleotide serves as a substrate for, e.g., RNase H, and the 5' and 3' portions (the "wings") are modified in such a fashion so as to have greater affinity for the
30 target RNA molecule but are unable to support nuclease activity (e.g., 2'-fluoro- or 2'-methoxyethoxy substituted). Other chimeras include "wingmers," that is, oligonucleotides in which the 5' portion of the oligonucleotide serves as a substrate for, e.g., RNase H,
35 whereas the 3' portion is modified in such a fashion so as

-21-

to have greater affinity for the target RNA molecule but is unable to support nuclease activity (e.g., 2'-fluoro- or 2'-methoxyethoxy substituted), or vice-versa.

The oligonucleotides in accordance with this invention
5 preferably comprise from about 8 to about 30 nucleotides.
It is more preferred that such oligonucleotides comprise from about 15 to 25 nucleotides. As is known in the art, a nucleotide is a base-sugar combination suitably bound to an adjacent nucleotide through a phosphodiester,
10 phosphorothioate or other covalent linkage.

The oligonucleotides used in accordance with this invention may be conveniently and routinely made through the well-known technique of solid phase synthesis. Equipment for such synthesis is sold by several vendors
15 including, for example, Applied Biosystems (Foster City, CA). Any other means for such synthesis known in the art may additionally or alternatively be employed. It is also known to use similar techniques to prepare other oligonucleotides such as the phosphorothioates and
20 alkylated derivatives.

The oligonucleotides of the present invention can be utilized as therapeutic compounds, diagnostic tools and as research reagents and kits. The term "therapeutic uses" is intended to encompass prophylactic, palliative and curative
25 uses wherein the oligonucleotides of the invention are contacted with animal cells either *in vivo* or *ex vivo*. When contacted with animal cells *ex vivo*, a therapeutic use includes incorporating such cells into an animal after treatment with one or more oligonucleotides of the
30 invention. While not intending to be bound to a particular utility, the *ex vivo* modulation of, e.g., T cell proliferation by the oligonucleotides of the invention can be employed in, for example, potential therapeutic modalities wherein it is desired to modulate the expression
35 of a B7 protein in APCs. As an example, oligonucleotides

-22-

that inhibit the expression of B7-1 proteins are expected to enhance the availability of B7-2 proteins on the surface of APCs, thus increasing the costimulatory effect of B7-2 on T cells ex vivo (Levine et al., *Science*, 1996, 272, 5 1939).

For therapeutic uses, an animal suspected of having a disease or disorder which can be treated or prevented by modulating the expression or activity of a B7 protein is, for example, treated by administering oligonucleotides in accordance with this invention. The oligonucleotides of the invention can be utilized in pharmaceutical compositions by adding an effective amount of an oligonucleotide to a suitable pharmaceutically acceptable diluent or carrier. Workers in the field have identified 10 antisense, triplex and other oligonucleotide compositions which are capable of modulating expression of genes implicated in viral, fungal and metabolic diseases. Antisense oligonucleotides have been safely administered to humans and several clinical trials are presently underway. 15 It is thus established that oligonucleotides can be useful therapeutic instrumentalities that can be configured to be useful in treatment regimes for treatment of cells, tissues and animals, especially humans.

The oligonucleotides of the present invention can be 25 further used to detect the presence of B7-specific nucleic acids in a cell or tissue sample. For example, radiolabeled oligonucleotides can be prepared by ³²P labeling at the 5' end with polynucleotide kinase (Sambrook et al., *Molecular Cloning. A Laboratory Manual*, Cold Spring Harbor Laboratory Press, 1989, Volume 2, pg. 10.59). 30 Radiolabeled oligonucleotides are then contacted with cell or tissue samples suspected of containing B7 message RNAs (and thus B7 proteins), and the samples are washed to remove unbound oligonucleotide. Radioactivity remaining in 35 the sample indicates the presence of bound oligonucleotide,

-23-

which in turn indicates the presence of nucleic acids complementary to the oligonucleotide, and can be quantitated using a scintillation counter or other routine means. Expression of nucleic acids encoding these proteins is thus detected.

Radiolabeled oligonucleotides of the present invention can also be used to perform autoradiography of tissues to determine the localization, distribution and quantitation of B7 proteins for research, diagnostic or therapeutic purposes. In such studies, tissue sections are treated with radiolabeled oligonucleotide and washed as described above, then exposed to photographic emulsion according to routine autoradiography procedures. The emulsion, when developed, yields an image of silver grains over the regions expressing a B7 gene. Quantitation of the silver grains permits detection of the expression of mRNA molecules encoding these proteins and permits targeting of oligonucleotides to these areas.

Analogous assays for fluorescent detection of expression of B7 nucleic acids can be developed using oligonucleotides of the present invention which are conjugated with fluorescein or other fluorescent tags instead of radiolabeling. Such conjugations are routinely accomplished during solid phase synthesis using fluorescently-labeled amidites or controlled pore glass (CPG) columns. Fluorescein-labeled amidites and CPG are available from, e.g., Glen Research, Sterling VA.

The present invention employs oligonucleotides targeted to nucleic acids encoding B7 proteins and oligonucleotides targeted to nucleic acids encoding such proteins. Kits for detecting the presence or absence of expression of a B7 protein may also be prepared. Such kits include an oligonucleotide targeted to an appropriate gene, i.e., a gene encoding a B7 protein. Appropriate kit and assay formats, such as, e.g., "sandwich" assays, are known

-24-

in the art and can easily be adapted for use with the oligonucleotides of the invention. Hybridization of the oligonucleotides of the invention with a nucleic acid encoding a B7 protein can be detected by means known in the art. Such means may include conjugation of an enzyme to the oligonucleotide, radiolabelling of the oligonucleotide or any other suitable detection systems. Kits for detecting the presence or absence of a B7 protein may also be prepared.

10 In the context of this invention, "hybridization" means hydrogen bonding, which may be Watson-Crick, Hoogsteen or reversed Hoogsteen hydrogen bonding, between complementary nucleotides. For example, adenine and thymine are complementary nucleobases which pair through
15 the formation of hydrogen bonds. "Complementary," as used herein, refers to the capacity for precise pairing between two nucleotides. For example, if a nucleotide at a certain position of an oligonucleotide is capable of hydrogen bonding with a nucleotide at the same position of a DNA or
20 RNA molecule, then the oligonucleotide and the DNA or RNA are considered to be complementary to each other at that position. The oligonucleotide and the DNA or RNA are complementary to each other when a sufficient number of corresponding positions in each molecule are occupied by
25 nucleotides which can hydrogen bond with each other. Thus, "specifically hybridizable" and "complementary" are terms which are used to indicate a sufficient degree of complementarity or precise pairing such that stable and specific binding occurs between the oligonucleotide and the
30 DNA or RNA target. It is understood in the art that an oligonucleotide need not be 100% complementary to its target DNA sequence to be specifically hybridizable. An oligonucleotide is specifically hybridizable when binding of the oligonucleotide to the target DNA or RNA molecule
35 interferes with the normal function of the target DNA or

-25-

RNA to cause a decrease or loss of function, and there is a sufficient degree of complementarity to avoid non-specific binding of the oligonucleotide to non-target sequences under conditions in which specific binding is desired, i.e., under physiological conditions in the case of *in vivo* assays or therapeutic treatment, or in the case of *in vitro* assays, under conditions in which the assays are performed.

The formulation of therapeutic compositions and their subsequent administration is believed to be within the skill of those in the art. In general, for therapeutics, a patient in need of such therapy is administered an oligonucleotide in accordance with the invention, commonly in a pharmaceutically acceptable carrier, in doses ranging from 0.01 μ g to 100 g per kg of body weight depending on the age of the patient and the severity of the disorder or disease state being treated. Further, the treatment regimen may last for a period of time which will vary depending upon the nature of the particular disease or disorder, its severity and the overall condition of the patient, and may extend from once daily to once every 20 years. Following treatment, the patient is monitored for changes in his/her condition and for alleviation of the symptoms of the disorder or disease state. The dosage of the oligonucleotide may either be increased in the event the patient does not respond significantly to current dosage levels, or the dose may be decreased if an alleviation of the symptoms of the disorder or disease state is observed, or if the disorder or disease state has been ablated.

In some cases, it may be more effective to treat a patient with an oligonucleotide of the invention in conjunction with other therapeutic modalities in order to increase the efficacy of a treatment regimen. In the context of the invention, the term "treatment regimen" is meant to encompass therapeutic, palliative and prophylactic

-26-

modalities. In a preferred embodiment, the oligonucleotides of the invention are used in conjunction with an anti-inflammatory and/or immunosuppressive agent, preferably one or more antisense oligonucleotides targeted to an intercellular adhesion molecule (ICAM), preferably to ICAM-1. Other anti-inflammatory and/or immunosuppressive agents that may be used in combination with the oligonucleotides of the invention include, but are not limited to, soluble ICAM proteins (e.g., sICAM-1), antibody-toxin conjugates, prednisone, methylprednisolone, azathioprine, cyclophosphamide, cyclosporine, interferons, sympathomimetics, conventional antihistamines (histamine H₁ receptor antagonists, including, for example, brompheniramine maleate, chlorpheniramine maleate, dexchlorpheniramine maleate, triprolidine HCl, carbinoxamine maleate, clemastine fumarate, dimenhydrinate, diphenhydramine HCl, diphenylpyraline HCl, doxylamine succinate, tripeleonnamine citrate, tripeleonnamine HCl, cyclizine HCl, hydroxyzine HCl, meclizine HCl, methdilazine HCl, promethazine HCl, trimeprazine tartrate, azatadine maleate, cyproheptadine HCl, terfenadine, etc.), histamine H₂ receptor antagonists (e.g., ranitidine). See, generally, *The Merck Manual of Diagnosis and Therapy*, 15th Ed., Berkow et al., eds., 1987, Rahway, N.J., pages 302-336 and 2516-2522). When used with the compounds of the invention, such agents may be used individually, sequentially, or in combination with one or more other such agents.

In another preferred embodiment of the invention, an antisense oligonucleotide targeted to one B7 mRNA species (e.g., B7-1) is used in combination with an antisense oligonucleotide targeted to a second B7 mRNA species (e.g., B7-2) in order to inhibit the costimulatory effect of B7 molecules to a more extensive degree than can be achieved with either oligonucleotide used individually. In a related version of this embodiment, two or more

-27-

oligonucleotides of the invention, each targeted to an alternatively spliced B7-1 or B7-2 mRNA, are combined with each other in order to inhibit expression of both forms of the alternatively spliced mRNAs. It is known in the art
5 that, depending on the specificity of the modulating agent employed, inhibition of one form of an alternatively spliced mRNA may not result in a sufficient reduction of expression for a given condition to be manifest. Thus, such combinations may, in some instances, be desired to
10 inhibit the expression of a particular B7 gene to an extent necessary to practice one of the methods of the invention.

Following successful treatment, it may be desirable to have the patient undergo maintenance therapy to prevent the recurrence of the disease state, wherein the
15 oligonucleotide is administered in maintenance doses, ranging from 0.01 μ g to 100 g per kg of body weight, once or more daily, to once every 20 years. In the case of in individual known or suspected of being prone to an autoimmune or inflammatory condition, prophylactic effects
20 may be achieved by administration of preventative doses, ranging from 0.01 μ g to 100 g per kg of body weight, once or more daily, to once every 20 years. In like fashion, an individual may be made less susceptible to an inflammatory condition that is expected to occur as a result of some
25 medical treatment, e.g., graft versus host disease resulting from the transplantation of cells, tissue or an organ into the individual.

The pharmaceutical compositions of the present invention may be administered in a number of ways depending
30 upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including ophthalmic and to mucous membranes including vaginal and rectal delivery), pulmonary, e.g., by inhalation or insufflation of powders or aerosols,
35 including by nebulizer; intratracheal, intranasal,

-28-

epidermal and transdermal, oral or parenteral. Parenteral administration includes intravenous, intraarterial, subcutaneous, intraperitoneal or intramuscular injection or infusion; or intracranial, e.g., intrathecal or
5 intraventricular, administration. Oligonucleotides with at least one 2'-O-methoxyethyl modification are believed to be particularly useful for oral administration.

Formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels,
10 drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable. Coated condoms, gloves and the like may also be useful.

15 Compositions for oral administration include powders or granules, suspensions or solutions in water or non-aqueous media, capsules, sachets or tablets. Thickeners, flavoring agents, diluents, emulsifiers, dispersing aids or binders may be desirable.

20 Compositions for parenteral, intrathecal or intraventricular administration may include sterile aqueous solutions which may also contain buffers, diluents and other suitable additives.

Dosing is dependent on severity and responsiveness of
25 the disease state to be treated, with the course of treatment lasting from several days to several months, or until a cure is effected or a diminution of the disease state is achieved. Optimal dosing schedules can be calculated from measurements of drug accumulation in the
30 body of the patient. Persons of ordinary skill can easily determine optimum dosages, dosing methodologies and repetition rates. Optimum dosages may vary depending on the relative potency of individual oligonucleotides, and can generally be estimated based on EC_{50} s found to be
35 effective in *in vitro* and *in vivo* animal models. In

-29-

general, dosage is from 0.01 μ g to 100 g per kg of body weight, and may be given once or more daily, weekly, monthly or yearly, or even once every 2 to 20 years.

The following examples illustrate the invention and
5 are not intended to limit the same. Those skilled in the art will recognize, or be able to ascertain through routine experimentation, numerous equivalents to the specific substances and procedures described herein. Such equivalents are considered to be within the scope of the
10 present invention.

The following examples are provided for illustrative purposes only and are not intended to limit the invention.

EXAMPLES

Example 1: Synthesis of Nucleic Acids

15 Oligonucleotides

Oligonucleotides were synthesized on an automated DNA synthesizer using standard phosphoramidite chemistry with oxidation using iodine. β -Cyanoethyldiisopropyl phosphoramidites were purchased from Applied Biosystems
20 (Foster City, CA). For phosphorothioate oligonucleotides, the standard oxidation bottle was replaced by a 0.2 M solution of 3H-1,2-benzodithiole-3-one-1,1-dioxide in acetonitrile for the stepwise thiation of the phosphite linkages. The thiation cycle wait step was increased to 68
25 seconds and was followed by the capping step.

The 2'-fluoro phosphorothioate oligonucleotides of the invention were synthesized using 5'-dimethoxytrityl-3'-phosphoramidites and prepared as disclosed in U.S. patent application Serial No. 463,358, filed January 11, 1990, and
30 Serial No. 566,977, filed August 13, 1990, which are assigned to the same assignee as the instant application and which are incorporated by reference herein. The 2'-fluoro oligonucleotides were prepared using phosphoramidite chemistry and a slight modification of the standard DNA

-30-

synthesis protocol: deprotection was effected using methanolic ammonia at room temperature.

The 2'-methoxy (2'-O-methyl) oligonucleotides of the invention were synthesized using 2'-methoxy β -
5 cyanoethyldiisopropyl-phosphoramidites (Chemgenes, Needham MA) and the standard cycle for unmodified oligonucleotides, except the wait step after pulse delivery of tetrazole and base is increased to 360 seconds. Other 2'-alkoxy oligonucleotides are synthesized by a modification of this
10 method, using appropriate 2'-modified amidites such as those available from Glen Research, Inc., Sterling, VA. The 3'-base used to start the synthesis was a 2'-deoxyribonucleotide. The 2'-O-propyl oligonucleotides of the invention are prepared by a slight modification of this
15 procedure.

The 2' methoxyethoxy (2'-O-CH₂CH₂OCH₃) oligonucleotides of the invention were synthesized according to the method of Martin, *Helv. Chim. Acta* 1995, 78, 486. For ease of synthesis, the last nucleotide was a deoxynucleotide. All
20 2'-O-CH₂CH₂OCH₃ cytosines were 5-methyl cytosines, which were synthesized according to the following procedures.

Synthesis of 5-Methyl cytosine monomers:

2,2'-Anhydro[1-(β -D-arabinofuranosyl)-5-methyluridine]
5-Methyluridine (ribosylthymine, commercially
25 available through Yamasa, Choshi, Japan) (72.0 g, 0.279 M), diphenylcarbonate (90.0 g, 0.420 M) and sodium bicarbonate (2.0 g, 0.024 M) were added to DMF (300 mL). The mixture was heated to reflux, with stirring, allowing the evolved carbon dioxide gas to be released in a controlled manner.
30 After 1 hour, the slightly darkened solution was concentrated under reduced pressure. The resulting syrup was poured into diethylether (2.5 L), with stirring. The product formed a gum. The ether was decanted and the residue was dissolved in a minimum amount of methanol (ca.
35 400 mL). The solution was poured into fresh ether (2.5 L)

-31-

to yield a stiff gum. The ether was decanted and the gum was dried in a vacuum oven (60°C at 1 mm Hg for 24 h) to give a solid which was crushed to a light tan powder (57 g, 85% crude yield). The material was used as is for further
5 reactions.

2'-O-Methoxyethyl-5-methyluridine

2,2'-Anhydro-5-methyluridine (195 g, 0.81 M), tris(2-methoxyethyl)borate (231 g, 0.98 M) and 2-methoxyethanol (1.2 L) were added to a 2 L stainless steel pressure vessel
10 and placed in a pre-heated oil bath at 160°C. After heating for 48 hours at 155-160°C, the vessel was opened and the solution evaporated to dryness and triturated with MeOH (200 mL). The residue was suspended in hot acetone (1 L). The insoluble salts were filtered, washed with acetone (150
15 mL) and the filtrate evaporated. The residue (280 g) was dissolved in CH₃CN (600 mL) and evaporated. A silica gel column (3 kg) was packed in CH₂Cl₂/acetone/MeOH (20:5:3) containing 0.5% Et₃NH. The residue was dissolved in CH₂Cl₂ (250 mL) and adsorbed onto silica (150 g) prior to loading
20 onto the column. The product was eluted with the packing solvent to give 160 g (63%) of product.

2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine

2'-O-Methoxyethyl-5-methyluridine (160 g, 0.506 M) was co-evaporated with pyridine (250 mL) and the dried residue
25 dissolved in pyridine (1.3 L). A first aliquot of dimethoxytrityl chloride (94.3 g, 0.278 M) was added and the mixture stirred at room temperature for one hour. A second aliquot of dimethoxytrityl chloride (94.3 g, 0.278 M) was added and the reaction stirred for an additional one
30 hour. Methanol (170 mL) was then added to stop the reaction. HPLC showed the presence of approximately 70% product. The solvent was evaporated and triturated with CH₃CN (200 mL). The residue was dissolved in CHCl₃ (1.5 L) and extracted with 2x500 mL of saturated NaHCO₃ and 2x500 mL
35 of saturated NaCl. The organic phase was dried over Na₂SO₄,

-32-

filtered and evaporated. 275 g of residue was obtained. The residue was purified on a 3.5 kg silica gel column, packed and eluted with EtOAc/Hexane/Acetone (5:5:1) containing 0.5% Et₃NH. The pure fractions were evaporated
5 to give 164 g of product. Approximately 20 g additional was obtained from the impure fractions to give a total yield of 183 g (57%).

3'-O-Acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine

10 2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine (106 g, 0.167 M), DMF/pyridine (750 mL of a 3:1 mixture prepared from 562 mL of DMF and 188 mL of pyridine) and acetic anhydride (24.38 mL, 0.258 M) were combined and stirred at room temperature for 24 hours. The reaction was
15 monitored by tlc by first quenching the tlc sample with the addition of MeOH. Upon completion of the reaction, as judged by tlc, MeOH (50 mL) was added and the mixture evaporated at 35°C. The residue was dissolved in CHCl₃ (800 mL) and extracted with 2x200 mL of saturated sodium
20 bicarbonate and 2x200 mL of saturated NaCl. The water layers were back extracted with 200 mL of CHCl₃. The combined organics were dried with sodium sulfate and evaporated to give 122 g of residue (approx. 90% product). The residue was purified on a 3.5 kg silica gel column and
25 eluted using EtOAc/Hexane(4:1). Pure product fractions were evaporated to yield 96 g (84%).

3'-O-Acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyl-4-triazoleuridine

A first solution was prepared by dissolving 3'-O-
30 acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine (96 g, 0.144 M) in CH₃CN (700 mL) and set aside. Triethylamine (189 mL, 1.44 M) was added to a solution of triazole (90 g, 1.3 M) in CH₃CN (1 L), cooled to -5°C and stirred for 0.5 h using an overhead stirrer. POCl₃,
35 was added dropwise, over a 30 minute period, to the stirred

-33-

solution maintained at 0-10°C, and the resulting mixture stirred for an additional 2 hours. The first solution was added to the later solution dropwise, over a 45 minute period. The resulting reaction mixture was stored
5 overnight in a cold room. Salts were filtered from the reaction mixture and the solution was evaporated. The residue was dissolved in EtOAc (1 L) and the insoluble solids were removed by filtration. The filtrate was washed with 1x300 mL of NaHCO₃ and 2x300 mL of saturated NaCl,
10 dried over sodium sulfate and evaporated. The residue was triturated with EtOAc to give the title compound.

2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine

A solution of 3'-O-acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyl-4-triazoleuridine (103 g, 0.141 M)
15 in dioxane (500 mL) and NH₄OH (30 mL) was stirred at room temperature for 2 hours. The dioxane solution was evaporated and the residue azeotroped with MeOH (2x200 mL). The residue was dissolved in MeOH (300 mL) and transferred
20 to a 2 liter stainless steel pressure vessel. MeOH (400 mL) saturated with NH₃ gas was added and the vessel heated to 100°C for 2 hours (tlc showed complete conversion). The vessel contents were evaporated to dryness and the residue was dissolved in EtOAc (500 mL) and washed once with
25 saturated NaCl (200 mL). The organics were dried over sodium sulfate and the solvent was evaporated to give 85 g (95%) of the title compound.

N⁴-Benzoyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine

30 2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine (85 g, 0.134 M) was dissolved in DMF (800 mL) and benzoic anhydride (37.2 g, 0.165 M) was added with stirring. After stirring for 3 hours, tlc showed the reaction to be approximately 95% complete. The solvent was
35 evaporated and the residue azeotroped with MeOH (200 mL).

-34-

The residue was dissolved in CHCl_3 (700 mL) and extracted with saturated NaHCO_3 (2x300 mL) and saturated NaCl (2x300 mL), dried over MgSO_4 and evaporated to give a residue (96 g). The residue was chromatographed on a 1.5 kg silica column using EtOAc/Hexane (1:1) containing 0.5% Et_3NH as the eluting solvent. The pure product fractions were evaporated to give 90 g (90%) of the title compound.

N^4 -Benzoyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine-3'-amidite

10 N^4 -Benzoyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine (74 g, 0.10 M) was dissolved in CH_2Cl_2 (1 L). Tetrazole diisopropylamine (7.1 g) and 2-cyanoethoxy-tetra(isopropyl)phosphite (40.5 mL, 0.123 M) were added with stirring, under a nitrogen atmosphere. The resulting mixture was stirred for 20 hours at room temperature (tlc showed the reaction to be 95% complete). The reaction mixture was extracted with saturated NaHCO_3 (1x300 mL) and saturated NaCl (3x300 mL). The aqueous washes were back-extracted with CH_2Cl_2 (300 mL), and the extracts were combined, dried over MgSO_4 and concentrated. The residue obtained was chromatographed on a 1.5 kg silica column using EtOAc/Hexane (3:1) as the eluting solvent. The pure fractions were combined to give 90.6 g (87%) of the title compound.

25 **2'-O-(Aminooxyethyl) nucleoside amidites and 2'-O-(dimethylaminooxyethyl) nucleoside amidites**

2'-(Dimethylaminooxyethoxy) nucleoside amidites

2'-(Dimethylaminooxyethoxy) nucleoside amidites [also known in the art as 2'-O-(dimethylaminooxyethyl) nucleoside amidites] are prepared as described in the following paragraphs. Adenosine, cytidine and guanosine nucleoside amidites are prepared similarly to the thymidine (5-methyluridine) except the exocyclic amines are protected

-35-

with a benzoyl moiety in the case of adenosine and cytidine and with isobutyryl in the case of guanosine.

5'-O-tert-Butyldiphenylsilyl-02-2'-anhydro-5-methyluridine

5 O²-2'-anhydro-5-methyluridine (Pro. Bio. Sint., Varese, Italy, 100.0g, 0.416 mmol), dimethylaminopyridine (0.66g, 0.013eq, 0.0054mmol) were dissolved in dry pyridine (500 ml) at ambient temperature under an argon atmosphere and with mechanical stirring. tert-Butyldiphenylchlorosilane
10 (125.8g, 119.0mL, 1.1eq, 0.458mmol) was added in one portion. The reaction was stirred for 16 h at ambient temperature. TLC (R_f 0.22, ethyl acetate) indicated a complete reaction. The solution was concentrated under reduced pressure to a thick oil. This was partitioned
15 between dichloromethane (1 L) and saturated sodium bicarbonate (2x1 L) and brine (1 L). The organic layer was dried over sodium sulfate and concentrated under reduced pressure to a thick oil. The oil was dissolved in a 1:1 mixture of ethyl acetate and ethyl ether (600mL) and the
20 solution was cooled to -10°C. The resulting crystalline product was collected by filtration, washed with ethyl ether (3x200 mL) and dried (40°C, 1mm Hg, 24 h) to 149g (74.8%) of white solid. TLC and NMR were consistent with pure product.

25 **5'-O-tert-Butyldiphenylsilyl-2'-O-(2-hydroxyethyl)-5-methyluridine**

In a 2 L stainless steel, unstirred pressure reactor was added borane in tetrahydrofuran (1.0 M, 2.0 eq, 622 mL). In the fume hood and with manual stirring, ethylene
30 glycol (350 mL, excess) was added cautiously at first until the evolution of hydrogen gas subsided.

5'-O-tert-Butyldiphenylsilyl-O²--2'-anhydro-5-methyluridine (149 g, 0.311 mol) and sodium bicarbonate (0.074 g, 0.003 eq) were added with manual stirring. The reactor was

-36-

sealed and heated in an oil bath until an internal temperature of 160°C was reached and then maintained for 16 h (pressure < 100 psig). The reaction vessel was cooled to ambient and opened. TLC (Rf 0.67 for desired product and 5 Rf 0.82 for ara-T side product, ethyl acetate) indicated about 70% conversion to the product. In order to avoid additional side product formation, the reaction was stopped, concentrated under reduced pressure (10 to 1mm Hg) in a warm water bath (40-100°C) with the more extreme 10 conditions used to remove the ethylene glycol.

[Alternatively, once the low boiling solvent is gone, the remaining solution can be partitioned between ethyl acetate and water. The product will be in the organic phase.] The residue was purified by column chromatography (2kg silica 15 gel, ethyl acetate-hexanes gradient 1:1 to 4:1). The appropriate fractions were combined, stripped and dried to product as a white crisp foam (84g, 50%), contaminated starting material (17.4g) and pure reusable starting material 20g. The yield based on starting material less 20 pure recovered starting material was 58%. TLC and NMR were consistent with 99% pure product.

2'-O-([2-phthalimidoxy)ethyl]-5'-*t*-butyldiphenylsilyl-5-methyluridine

5'-O-tert-Butyldiphenylsilyl-2'-O-(2-hydroxyethyl)-5- 25 methyluridine (20g, 36.98mmol) was mixed with triphenylphosphine (11.63g, 44.36mmol) and N-hydroxyphthalimide (7.24g, 44.36mmol). It was then dried over P₂O₅ under high vacuum for two days at 40°C. The reaction mixture was flushed with argon and dry THF 30 (369.8mL, Aldrich, sure seal bottle) was added to get a clear solution. Diethyl-azodicarboxylate (6.98mL, 44.36mmol) was added dropwise to the reaction mixture. The rate of addition is maintained such that resulting deep red coloration is just discharged before adding the next drop. 35 After the addition was complete, the reaction was stirred

-37-

for 4 hrs. By that time TLC showed the completion of the reaction (ethylacetate:hexane, 60:40). The solvent was evaporated in vacuum. Residue obtained was placed on a flash column and eluted with ethyl acetate:hexane (60:40),

5 to get

2'-O-([2-phthalimidooxy)ethyl]-5'-t-butyldiphenylsilyl-5-methyluridine as white foam (21.819 g, 86%).

5'-O-tert-butyldiphenylsilyl-2'-O-[(2-formadoximinooxy)ethyl]-5-methyluridine

10 2'-O-([2-phthalimidooxy)ethyl]-5'-t-butyldiphenylsilyl-5-methyluridine (3.1g, 4.5mmol) was dissolved in dry CH_2Cl_2 (4.5mL) and methylhydrazine (300mL, 4.64mmol) was added dropwise at -10°C to 0°C . After 1 h the mixture was filtered, the filtrate was washed with ice cold CH_2Cl_2 and
15 the combined organic phase was washed with water, brine and dried over anhydrous Na_2SO_4 . The solution was concentrated to get 2'-O-(aminooxyethyl) thymidine, which was then dissolved in MeOH (67.5mL). To this formaldehyde (20% aqueous solution, w/w, 1.1 eq.) was added and the resulting
20 mixture was stirred for 1 h. Solvent was removed under vacuum; residue chromatographed to get

5'-O-tert-butyldiphenylsilyl-2'-O-[(2-formadoximinooxy)ethyl]-5-methyluridine as white foam (1.95 g, 78%).

5'-O-tert-Butyldiphenylsilyl-2'-O-[N,N-dimethylaminooxyethyl]-5-methyluridine

25

5'-O-tert-butyldiphenylsilyl-2'-O-[(2-

formadoximinooxy)ethyl]-5-methyluridine (1.77g, 3.12mmol) was dissolved in a solution of 1M pyridinium p-toluenesulfonate (PPTS) in dry MeOH (30.6mL). Sodium

30

cyanoborohydride (0.39g, 6.13mmol) was added to this solution at 10°C under inert atmosphere. The reaction mixture was stirred for 10 minutes at 10°C . After that the reaction vessel was removed from the ice bath and stirred at room temperature for 2 h, the reaction monitored by TLC

-38-

(5% MeOH in CH_2Cl_2). Aqueous NaHCO_3 solution (5%, 10mL) was added and extracted with ethyl acetate (2x20mL). Ethyl acetate phase was dried over anhydrous Na_2SO_4 , evaporated to dryness. Residue was dissolved in a solution of 1M PPTS in 5 MeOH (30.6mL). Formaldehyde (20% w/w, 30mL, 3.37mmol) was added and the reaction mixture was stirred at room temperature for 10 minutes. Reaction mixture cooled to 10°C in an ice bath, sodium cyanoborohydride (0.39g, 6.13mmol) was added and reaction mixture stirred at 10°C 10 for 10 minutes. After 10 minutes, the reaction mixture was removed from the ice bath and stirred at room temperature for 2 hrs. To the reaction mixture 5% NaHCO_3 (25mL) solution was added and extracted with ethyl acetate (2x25mL). Ethyl acetate layer was dried over anhydrous 15 Na_2SO_4 and evaporated to dryness. The residue obtained was purified by flash column chromatography and eluted with 5% MeOH in CH_2Cl_2 to get 5'-O-tert-butyldiphenylsilyl-2'-O-[N,N-dimethylaminoxyethyl]-5-methyluridine as a white foam (14.6g, 80%).

20 2'-O-(dimethylaminoxyethyl)-5-methyluridine

Triethylamine trihydrofluoride (3.91mL, 24.0mmol) was dissolved in dry THF and triethylamine (1.67mL, 12mmol, dry, kept over KOH). This mixture of triethylamine-2HF was then added to 5'-O-tert-butyldiphenylsilyl-2'-O-[N,N- 25 dimethylaminoxyethyl]-5-methyluridine (1.40g, 2.4mmol) and stirred at room temperature for 24 hrs. Reaction was monitored by TLC (5% MeOH in CH_2Cl_2). Solvent was removed under vacuum and the residue placed on a flash column and eluted with 10% MeOH in CH_2Cl_2 to get 30 2'-O-(dimethylaminoxyethyl)-5-methyluridine (766mg, 92.5%).

5'-O-DMT-2'-O-(dimethylaminoxyethyl)-5-methyluridine

2'-O-(dimethylaminoxyethyl)-5-methyluridine (750mg, 2.17mmol) was dried over P_2O_5 under high vacuum overnight at 35 40°C. It was then co-evaporated with anhydrous pyridine

-39-

(20mL). The residue obtained was dissolved in pyridine (11mL) under argon atmosphere. 4-dimethylaminopyridine (26.5mg, 2.60mmol), 4,4'-dimethoxytrityl chloride (880mg, 2.60mmol) was added to the mixture and the reaction mixture
5 was stirred at room temperature until all of the starting material disappeared. Pyridine was removed under vacuum and the residue chromatographed and eluted with 10% MeOH in CH_2Cl_2 (containing a few drops of pyridine) to get
5'-O-DMT-2'-O-(dimethylamino-oxyethyl)-5-methyluridine
10 (1.13g, 80%).

5'-O-DMT-2'-O-(2-N,N-dimethylaminooxyethyl)-5-methyluridine-3'-[(2-cyanoethyl)-N,N-diisopropylphosphoramidite]

5'-O-DMT-2'-O-(dimethylaminooxyethyl)-5-methyluridine
15 (1.08g, 1.67mmol) was co-evaporated with toluene (20mL). To the residue N,N-diisopropylamine tetrazonide (0.29g, 1.67mmol) was added and dried over P2O5 under high vacuum overnight at 40°C. Then the reaction mixture was dissolved in anhydrous acetonitrile (8.4mL) and
20 2-cyanoethyl-N,N,N1,N1-tetraisopropylphosphoramidite (2.12mL, 6.08mmol) was added. The reaction mixture was stirred at ambient temperature for 4 hrs under inert atmosphere. The progress of the reaction was monitored by TLC (hexane:ethyl acetate 1:1). The solvent was
25 evaporated, then the residue was dissolved in ethyl acetate (70mL) and washed with 5% aqueous NaHCO_3 (40mL). Ethyl acetate layer was dried over anhydrous Na_2SO_4 and concentrated. Residue obtained was chromatographed (ethyl acetate as eluent) to get
30 5'-O-DMT-2'-O-(2-N,N-dimethylaminooxyethyl)-5-methyluridine-3'-[(2-cyanoethyl)-N,N-diisopropylphosphoramidite] as a foam (1.04g, 74.9%).

2'-(Aminoxyethoxy) nucleoside amidites

2'-(Aminoxyethoxy) nucleoside amidites [also known in the
35 art as 2'-O-(aminoxyethyl) nucleoside amidites] are

-40-

prepared as described in the following paragraphs.

Adenosine, cytidine and thymidine nucleoside amidites are prepared similarly.

5 **N2-isobutyryl-6-O-diphenylcarbamoyl-2'-O-(2-ethylacetyl)- 5'-O-(4,4'-dimethoxytrityl)guanosine-3'-[(2-cyanoethyl)-N,N-diisopropylphosphoramidite]**

The 2'-O-aminooxyethyl guanosine analog may be obtained by selective 2'-O-alkylation of diaminopurine riboside. Multigram quantities of diaminopurine riboside 10 may be purchased from Schering AG (Berlin) to provide 2'-O-(2-ethylacetyl) diaminopurine riboside along with a minor amount of the 3'-O-isomer. 2'-O-(2-ethylacetyl) diaminopurine riboside may be resolved and converted to 2'-O-(2-ethylacetyl)guanosine by treatment with adenosine 15 deaminase. (McGee, D. P. C., Cook, P. D., Guinasso, C. J., WO 94/02501 A1 940203.) Standard protection procedures should afford 2'-O-(2-ethylacetyl)-5'-O-(4,4'-dimethoxytrityl)guanosine and 2-N-isobutyryl-6-O-diphenylcarbamoyl-2'-O-(2-ethylacetyl)-5'-O-(4,4'-dimethoxytrityl)guanosine which may be reduced to provide 20 2-N-isobutyryl-6-O-diphenylcarbamoyl-2'-O-(2-ethylacetyl)-5'-O-(4,4'-dimethoxytrityl)guanosine. As before the hydroxyl group may be displaced by N-hydroxyphthalimide via a Mitsunobu reaction, and the protected nucleoside may 25 phosphitylated as usual to yield 2-N-isobutyryl-6-O-diphenylcarbamoyl-2'-O-(2-ethylacetyl)-5'-O-(4,4'-dimethoxytrityl)guanosine-3'-[(2-cyanoethyl)-N,N-diisopropylphosphoramidite].

30 **2'-dimethylaminoethoxyethoxy (2'-DMAEOE) nucleoside amidites**

2'-dimethylaminoethoxyethoxy nucleoside amidites (also known in the art as 2'-O-dimethylaminoethoxyethyl, i.e., 2'-O-CH₂-O-CH₂-N(CH₂)₂, or 2'-DMAEOE nucleoside amidites) are

-41-

prepared as follows. Other nucleoside amidites are prepared similarly.

2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyl
uridine

5 2[2-(Dimethylamino)ethoxy]ethanol (Aldrich, 6.66 g, 50 mmol) is slowly added to a solution of borane in tetrahydrofuran (1 M, 10 mL, 10 mmol) with stirring in a 100 mL bomb. Hydrogen gas evolves as the solid dissolves. O2-,2'-anhydro-5-methyluridine (1.2 g, 5 mmol), and sodium
10 bicarbonate (2.5 mg) are added and the bomb is sealed, placed in an oil bath and heated to 155 C for 26 hours. The bomb is cooled to room temperature and opened. The crude solution is concentrated and the residue partitioned between water (200 mL) and hexanes (200 mL). The excess
15 phenol is extracted into the hexane layer. The aqueous layer is extracted with ethyl acetate (3x200 mL) and the combined organic layers are washed once with water, dried over anhydrous sodium sulfate and concentrated. The residue is columned on silica gel using methanol/methylene
20 chloride 1:20 (which has 2% triethylamine) as the eluent. As the column fractions are concentrated a colorless solid forms which is collected to give the title compound as a white solid.

5'-O-dimethoxytrityl-2'-O-[2(2-N,N-dimethyl
25 aminoethoxy)ethyl]-5-methyl uridine

To 0.5 g (1.3 mmol) of 2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyl uridine in anhydrous pyridine (8 mL), triethylamine (0.36 mL) and dimethoxytrityl chloride (DMT-Cl, 0.87 g, 2 eq.) are added and stirred for 1 hour.
30 The reaction mixture is poured into water (200 mL) and extracted with CH₂Cl₂ (2x200 mL). The combined CH₂Cl₂ layers are washed with saturated NaHCO₃ solution, followed by saturated NaCl solution and dried over anhydrous sodium sulfate. Evaporation of the solvent followed by silica gel

-42-

chromatography using MeOH:CH₂Cl₂:Et₃N (20:1, v/v, with 1% triethylamine) gives the title compound.

5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]]-5-methyl uridine-3'-O-(cyanoethyl-N,N-diisopropyl)phosphoramidite

Diisopropylaminotetrazolide (0.6 g) and 2-cyanoethoxy-N,N-diisopropyl phosphoramidite (1.1 mL, 2 eq.) are added to a solution of 5'-O-dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]]-5-methyluridine (2.17 g, 3 mmol) dissolved in CH₂Cl₂ (20 mL) under an atmosphere of argon. The reaction mixture is stirred overnight and the solvent evaporated. The resulting residue is purified by silica gel flash column chromatography with ethyl acetate as the eluent to give the title compound.

15 Purification:

After cleavage from the controlled pore glass column (Applied Biosystems) and deblocking in concentrated ammonium hydroxide at 55°C for 18 hours, the oligonucleotides were purified by precipitation twice out of 0.5 M NaCl with 2.5 volumes ethanol. Analytical gel electrophoresis was accomplished in 20% acrylamide, 8 M urea, 45 mM Tris-borate buffer, pH 7.0. Oligodeoxynucleotides and their phosphorothioate analogs were judged from electrophoresis to be greater than 80% full length material.

B7 Antisense Oligonucleotides

A series of oligonucleotides with sequences designed to hybridize to the published human B7-1 (hB7-1) and murine (mB7-1) mRNA sequences (Freeman et al., *J. Immunol.*, 1989, 143, 2714, and Freeman et al., *J. Exp. Med.*, 1991, 174, 625 respectively). The sequences of and modifications to these oligonucleotides, and the location of each of their target sites on the hB7-1 mRNA, are given in Tables 1 and 2. Similarly, a series of oligonucleotides with sequences

-43-

designed to hybridize to the human B7-2 (hB7-2) and murine B7-2 (mB7-2) mRNA published sequences (respectively, Azuma et al., *Nature*, 1993, 366, 76; Chen et al., *J. Immunol.*, 1994, 152, 4929) were synthesized. The sequences of and
5 modifications to these oligonucleotides and the location of each of their target sites on the hB7-2 mRNA are described in Tables 3 and 4. Antisense oligonucleotides targeted to ICAM-1, including ISIS 2302 (SEQ ID NO: 17), have been described in U.S. Patent No. 5,514,788, which issued May 7,
10 1996, hereby incorporated by reference. ISIS 1082 (SEQ ID NO: 102) and ISIS 3082 (SEQ ID NO: 101) have been previously described (Stepkowski et al., *J. Immunol.*, 1994, 153, 5336).

Subsequent to their initial cloning, alternative
15 splicing events of B7 transcripts have been reported. The reported alternative splicing for B7-1 is relatively simple, in that it results in messages extended 5' relative to the 5' terminus of the human and murine B7-1 cDNA sequences originally reported (Borriello et al., *J.*
20 *Immunol.*, 1994, 153, 5038; Inobe et al., *J. Immunol.*, 1996, 157, 588). In order to retain the numbering of the B7-1 sequences found in the references initially reporting B7-1 sequences, positions within these 5' extensions of the initially reported sequences have been given negative
25 numbers (beginning with position -1, the most 3' base of the 5' extension) in Tables 1 and 2. The processing of murine B7-2 transcripts is considerably more complex than that so far reported for B7-1; for example, at least five distinct murine B7-2 mRNAs, and at least two distinct human
30 B7-2 mRNAs, can be produced by alternative splicing events (Borriello et al., *J. Immunol.*, 1995, 155, 5490; Freeman et al., WO 95/03408, published February 2, 1995; see also Jellis et al., *Immunogenet.*, 1995, 42, 85). The nature of these splicing events is such that different 5' exons are
35 used to produce distinct B7-2 mRNAs, each of which has a

-44-

unique 5' sequence but which share a 3' portion consisting of some or all of the B7-2 sequence initially reported. As a result, positions within the 5' extensions of B7-2 messages cannot be uniquely related to a position within the sequence initially reported. Accordingly, in Table 3, a different set of coordinates (corresponding to those of SEQ ID NO: 1 of WO 95/03408) and, in Table 4, the exon number (as given in Borriello et al., *J. Immunol.*, 1995, 155, 5490) is used to specify the location of targeted sequences which are not included in the initially reported B7-2 sequence. Furthermore, although these 5' extended messages contain potential in-frame start codons upstream from the ones indicated in the initially published sequences, for simplicity's sake, such additional potential start codons are not indicated in the description of target sites in Tables 1-4.

In Tables 1-4, the following abbreviations are used: UTR, untranslated region; ORF, open reading frame; tIR, translation initiation region; tTR, translation termination region; FITC, fluorescein isothiocyanate. Chemical modifications are indicated as follows. Residues having 2' fluoro (2'F), 2'-methoxy (2'MO) or 2'-methoxyethoxy (2'ME) modification are emboldened, with the type of modification being indicated by the respective abbreviations. Unless otherwise indicated, interresidue linkages are phosphodiester linkages; phosphorothioate linkages are indicated by an "S" in the superscript position (e.g., T^SA). Target positions are numbered according to Freeman et al., *J. Immunol.*, 1989, 143:2714 (human B7-1 cDNA sequence; Table 1), Freeman et al., *J. Exp. Med.*, 1991, 174, 625 (murine B7-1 cDNA sequence; Table 2), Azuma et al., *Nature*, 1993, 366:76 (human B7-2 cDNA sequence; Table 3) and Chen et al., *J. Immunol.*, 1994, 152:4929 (murine B7-2 cDNA sequence; Table 4). Nucleotide base codes are as given in 37 C.F.R. § 1.822(b)(1).

5

10

-55-

cDNA clones:

A cDNA encoding the sequence for human B7-1 was isolated by using the reverse transcription/polymerase chain reaction (RT-PCR). Poly A+ RNA from Daudi cells
5 (ATCC accession No. CCL 213) was reverse transcribed using oligo-dT primer under standard conditions. Following a 30 minute reaction at 42°C and heat inactivation, the reaction mixture (20 µL) was brought to 100 µL with water. A 10 µL aliquot from the RT reaction was then amplified in a 50 µL
10 PCR reaction using the 5' primer,

5'-GAT-CAG-GGT-ACC-CCA-AAG-AAA-AAG-TGA-TTT-GTC-ATT-GC-
3'

(sense, SEQ ID NO: 20), and the 3' primer,

5'-GAT-AGC-CTC-GAG-GAT-AAT-GAA-TTG-GCT-GAC-AAG-AC-3'
15 (antisense, SEQ ID NO: 21).

The primers included unique restriction sites for subcloning of the PCR product into the vector pcDNA-3 (Invitrogen, San Diego, CA). The 5' primer was designed to have identity with bases 1 to 26 of the published human B7-
20 1 sequence (Freeman et al., *J. Immunol.*, 1989, 143, 2714; positions 13-38 of the primer) and includes a Kpn I restriction site (positions 7-12 of the primer) for use in cloning. The 3' primer was designed to be complementary to bases 1450 to 1471 of the published sequence for B7-1
25 (positions 14-35 of the primer) and includes a Xho I restriction site (positions 7-12 of the primer). Following PCR, the reaction was extracted with phenol and precipitated using ethanol. The product was digested with the appropriate restriction enzymes and the full-length
30 fragment purified by agarose gel and ligated into the vector pcDNA-3 (Invitrogen, San Diego, CA) prepared by digesting with the same enzymes. The resultant construct, pcB7-1, was confirmed by restriction mapping and DNA sequence analysis using standard procedures. A mouse B7-1

-56-

clone, pcmB7-1, was isolated in a similar manner by RT-PCR of RNA isolated from a murine B-lymphocyte cell line, 70Z3.

A cDNA encoding the sequence for human B7-2, position 1 to 1391, was also isolated by RT-PCR. Poly A+ RNA from 5 Daudi cells (ATCC accession No. CCL 213) was reverse transcribed using oligo-dT primer under standard conditions. Following a 30 minute reaction at 42°C and heat inactivation, the reaction mixture (20 µL) was brought to 100 µL with water. A 10 µL aliquot from the RT reaction 10 was then amplified in a 50 µL PCR reaction using the 5' primer,

5'-GAT-CAG-GGT-ACC-AGG-AGC-CTT-AGG-AGG-TAC-GG-3'

(sense, SEQ ID NO: 1), and the 3' primer,

5'-GAT-AGC-CTC-GAG-TTA-TTT-CCA-GGT-CAT-GAG-CCA-3'

15 (antisense, SEQ ID NO: 2).

The 5' primer was designed to have identity with bases 1-20 of the published B7-2 sequence (Azuma et al., Nature, 1993, 366, 76 and Genbank Accession No. L25259; positions 13-32 of the primer) and includes a Kpn I site (positions 20 7-12 of the primer) for use in cloning. The 3' primer was designed to have complementarity to bases 1370-1391 of the published sequence for B7-2 (positions 13-33 of the primer) and includes an Xho I restriction site (positions 7-12 of the primer). Following PCR, the reaction was extracted 25 with phenol and precipitated using ethanol. The product was digested with Xho I and Kpn I, and the full-length fragment purified by agarose gel and ligated into the vector pcDNA-3 (Invitrogen, San Diego, CA) prepared by digesting with the same enzymes. The resultant construct, 30 pcB7-2, was confirmed by restriction mapping and DNA sequence analysis using standard procedures.

A mouse B7-2 clone, pcmB7-2, was isolated in a similar manner by RT-PCR of RNA isolated from P388D1 cells using the 5' primer,

-57-

5'-GAT-CAG-GGT-ACC-AAG-AGT-GGC-TCC-TGT-AGG-CA
(sense, SEQ ID NO: 99), and the 3' primer,

5'-GAT-AGC-CTC-GAG-GTA-GAA-TTC-CAA-TCA-GCT-GA
(antisense, SEQ ID NO: 100).

- 5 The 5' primer has identity with bases 1-20, whereas
the 3' primer is complementary to bases 1096-1115, of the
published murine B7-2 sequence (Chen et al., *J. Immun.*,
1994, 152, 4929). Both primers incorporate the respective
restriction enzyme sites found in the other 5' and 3'
10 primers used to prepare cDNA clones. The RT-PCR product
was restricted with Xho I and Kpn I and ligated into pcDNA-
3 (Invitrogen, San Diego, CA).

Other cDNA clones, corresponding to mRNAs resulting
from alternative splicing events, are cloned in like
15 fashion, using primers containing the appropriate
restriction sites and having identity with (5' primers), or
complementarity to (3' primers), the selected B7 mRNA.

**Example 2: Modulation of hB7-1 Expression by
Oligonucleotides**

- 20 The ability of oligonucleotides to inhibit B7-1
expression was evaluated by measuring the cell surface
expression of B7-1 in transfected COS-7 cells by flow
cytometry.

Methods:

- 25 A T-175 flask was seeded at 75% confluency with COS-7
cells (ATCC accession No. CRL 1651). The plasmid pcB7-1
was introduced into cells by standard calcium phosphate
transfection. Following a 4 hour transfection, the cells
were trypsinized and seeded in 12-well dishes at 80%
30 confluency. The cells were allowed to adhere to the
plastic for 1 hour and were then washed with phosphate-
buffered saline (PBS). OptiMEM™ (GIBCO-BRL, Gaithersburg,
MD) medium was added along with 15 µg/mL of Lipofectin™
(GIBCO-BRL, Gaithersburg, MD) and oligonucleotide at the
35 indicated concentrations. After four additional hours, the

-58-

cells were washed with phosphate buffered saline (PBS) and incubated with fresh oligonucleotide at the same concentration in DMEM (Dulbecco et al., *Virol.*, 1959, 8, 396; Smith et al., *Virol.*, 1960, 12, 185) with 10% fetal calf sera (FCS).

In order to monitor the effects of oligonucleotides on cell surface expression of B7-1, treated COS-7 cells were harvested by brief trypsinization 24-48 hours after oligonucleotide treatment. The cells were washed with PBS, then resuspended in 100 μ L of staining buffer (PBS, 0.2% BSA, 0.1% azide) with 5 μ L conjugated anti-B7-1-antibody (i.e., anti-hCD80-FITC, Ancell, Bayport, MN; FITC: fluorescein isothiocyanate). The cells were stained for 30 minutes at 4°C, washed with PBS, resuspended in 300 μ L containing 0.5% paraformaldehyde. Cells were harvested and the fluorescence profiles were determined using a flow cytometer.

Results:

The oligonucleotides shown in Table 1 were evaluated, in COS-7 cells transiently expressing B7-1 cDNA, for their ability to inhibit B7-1 expression. The results (Figure 1) identified ISIS 13805, targeted to the translation initiation codon region, and ISIS 13812, targeted to the 3' untranslated region (UTR), as the most active oligonucleotides with greater than 50% inhibition of B7-1 expression. These oligonucleotides are thus highly preferred. ISIS 13799 (targeted to the 5' untranslated region), ISIS 13802 (targeted to the 5' untranslated region), ISIS 13806 and 13807 (both targeted to the 5' region of the ORF), and ISIS 13810 (targeted to the central portion of the ORF) demonstrated 35% to 50% inhibition of B7-1 expression. These sequences are therefore also preferred.

Oligonucleotide ISIS 13800, which showed essentially no inhibition of B7-1 expression in the flow cytometry

-59-

assay, and ISIS Nos. 13805 and 13812 were then evaluated for their ability to inhibit cell surface expression of B7-1 at various concentrations of oligonucleotide. The results of these assays are shown in Figure 2. ISIS 13812 was a superior inhibitor of B7-1 expression with an IC_{50} of approximately 150 nM. ISIS 13800, targeted to the 5' UTR, was essentially inactive.

Example 3: Modulation of hB7-2 Protein by Oligonucleotides

10 In an initial screen, the ability of hB7-2 oligonucleotides to inhibit B7-2 expression was evaluated by measuring the cell surface expression of B7-2 in transfected COS-7 cells by flow cytometry. The methods used were similar to those given in Example 2, with the
15 exceptions that (1) COS-7 cells were transfected with the plasmids pbcB7-2 or BBG-58, a human ICAM-1 (CD54) expression vector (R&D Systems, Minneapolis, MN) introduced into cells by standard calcium phosphate transfection, (2) the oligonucleotides used were those described in Table 2,
20 and (3) a conjugated anti-B7-2 antibody (i.e., anti-hCD86-FITC or anti-CD86-PE, PharMingen, San Diego, CA; PE: phycoerythrin) was used during flow cytometry.

Results:

The results are shown in Figure 3. At a concentration
25 of 200 nM, ISIS 9133, ISIS 9139 and ISIS 10373 exhibited inhibitory activity of 50% or better and are therefore highly preferred. These oligonucleotides are targeted to the 3' untranslated region (ISIS 9133), the translation initiation codon region (ISIS 9139) and the 5' untranslated
30 region (ISIS 10373). At the same concentration, ISIS 10715, ISIS 10716 and ISIS 10721, which are scrambled controls for ISIS 9133, ISIS 9139 and ISIS 10373, respectively, showed no inhibitory activity. Treatment with ISIS 10367 and ISIS 10369 resulted in greater than 25%
35 inhibition, and these oligonucleotides are thus also

-60-

preferred. These oligonucleotides are targeted to the 5' (ISIS 10367) and 3' (ISIS 10369) untranslated regions.

Example 4: Modulation of hB7-2 mRNA by Oligonucleotides

Methods:

5 For ribonuclease protection assays, cells were harvested 18 hours after completion of oligonucleotide treatment using a Totally RNA™ kit (Ambion, Austin, TX). The probes for the assay were generated from plasmids pcB7-2 (linearized by digestion with Bgl II) and pTRI-b-actin
10 (Ambion Inc., Austin, TX). In vitro transcription of the linearized plasmid from the SP6 promoter was performed in the presence of α -³²P-UTP (800 Ci/mmol) yielding an antisense RNA complementary to the 3' end of B7-2 (position 1044-1391). The probe was gel-purified after treatment
15 with DNase I to remove DNA template. Ribonuclease protection assays were carried out using an RPA II™ kit (Ambion) according to the manufacturer's directions. Total RNA (5 μ g) was hybridized overnight, at 42°C, with 10⁵ cpm of the B7-2 probe or a control beta-actin probe. The
20 hybridization reaction was then treated, at 37°C for 30 minutes, with 0.4 units of RNase A and 2 units of RNase T1. Protected RNA was precipitated, resuspended in 10 μ L of gel loading buffer and electrophoresed on a 6% acrylamide gel with 50% w/v urea at 20 W. The gel was then exposed and
25 the lanes quantitated using a PhosphorImager (Molecular Dynamics, Sunnyvale, CA) essentially according to the manufacturer's instructions.

Results:

The extent of oligonucleotide-mediated hB7-2 mRNA
30 modulation generally paralleled the effects seen for hB7-2 protein (Table 5). As with the protein expression (flow cytometry) assays, the most active oligonucleotides were ISIS 9133, ISIS 9139 and 10373. None of the oligonucleotides tested had an inhibitory effect on the
35 expression of b-actin mRNA in the same cells.

Example 5: Additional hB7-1 and hB7-2 Oligonucleotides

Oligonucleotides having structures and/or sequences that were modified relative to the oligonucleotides identified during the initial screening were prepared.

25 These oligonucleotides were evaluated for their ability to modulate human B7-2 expression using the methods described in the previous Examples.

ISIS 10996, an oligonucleotide having a 15 nucleotide sequence derived from the 20 nucleotide sequence of ISIS 10373, was also prepared and evaluated. ISIS 10996 comprises 15 nucleotides, 5'-GCG-AGC-TCC-CCG-TAC (SEQ ID NO: 90) contained within the sequence of ISIS 10373. Both ISIS 10373 and 10996 overlap a potential stem-loop structure located within the B7-2 message comprising bases

-62-

1-67 of the sequence of hB7-2 presented by Azuma et al. (Nature, 1993, 366, 76). While not intending to be bound by any particular theory regarding their mode(s) of action, ISIS 10373 and ISIS 10996 have the potential to bind as
5 loop 1 pseudo-half-knots at a secondary structure within the target RNA. U.S. Patent 5,515,438, which issued April 30, 1996, the contents of which are hereby incorporated by reference, describes methods for modulating gene expression by the formation of pseudo-half-knots. Regardless of their
10 mode(s) of action, despite having a shorter length than ISIS 10373, the 15-mer ISIS 10996 is as (or more) active in the B7-2 protein expression assay than the 20-mer from which it is derived (Figure 4; ISIS 10721 is a scrambled control for ISIS 10373). A related 16-mer, ISIS 10889, was
15 also active in the B7-2 protein expression assay. However, a structurally related 14-mer (ISIS 10995), 13-mer (ISIS 10994), 12-mer (ISIS 10993), 11-mer (ISIS 10992) and 10-mer (ISIS 10991) exhibited little or no activity in this assay. ISIS 10996 was further derivatized in the following ways.

20 ISIS 10996 derivatives having 2' methoxethoxy substitutions were prepared, including a fully substituted derivative (ISIS 11539), "gapmers" (ISIS 11541 and 11543) and "wingmers" (ISIS 11545 and 11547). As explained in Example 5, the 2' methoxyethoxy substitution prevents the
25 action of some nucleases (e.g., RNase H) but enhances the affinity of the modified oligonucleotide for its target RNA molecule. These oligonucleotides are tested for their ability to modulate hB7-2 message or function according to the methods of Examples 3, 4, 7 and 8.

30 ISIS 10996 derivatives were prepared in order to be evaluated for their ability to recruit RNase L to a target RNA molecule, e.g., hB7-2 message. RNase L binds to, and is activated by, (2'-5')(A)_n, which is in turn produced from ATP by (2'-5')(A)_n synthetase upon activation by, e.g.,

-63-

interferon. RNase L has been implicated in antiviral mechanisms and in the regulation of cell growth as well (Sawai, *Chemica Scripta*, 1986, 21, 169; Charachon et al., *Biochemistry*, 1990, 29, 2550). The combination of anti-B7 oligonucleotides conjugated to (2'-5')(A)_n is expected to result in the activation of RNase L and its targeting to the B7 message complementary to the oligonucleotide sequence. The following oligonucleotides have identical sequences (i.e., that of ISIS 10996) and identical (2'-5')(A)₄ "caps" on their 5' termini: ISIS 12492, 12495, 12496 and 13107. The adenosyl residues have 3' hydroxyl groups and are linked to each other by phosphorothioate linkages. The (3'-5') portion of the oligonucleotide, which has a sequence complementary to a portion of the human B7-2 RNA, is conjugated to the (2'-5')(A)₄ "cap" via a phosphorothioate linkage from the 5' residue of the (3'-5') portion of the oligonucleotide to an *n*-aminohexyl linker which is bonded to the "cap" via another phosphorothioate linkage. In order to test a variety of chemically diverse oligonucleotides of this type for their ability to recruit RNase L to a specific message, different chemical modifications were made to this set of four oligonucleotides as follows. ISIS 12496 consists of unmodified oligonucleotides in the (3'-5') portion of the oligonucleotide. In ISIS 13107, phosphorothioate linkages replace the phosphate linkages found in naturally occurring nucleic acids. Phosphorothioate linkages are also employed in ISIS 12492 and 12495, which additionally have 2'-methoxyethoxy substitutions. These oligonucleotides are tested for their ability to modulate hB7-2 message or function according to the methods of Examples 3, 4, 7 and 8.

Derivatives of ISIS 10996 having modifications at the 2' position were prepared and evaluated. The modified

-64-

oligonucleotides included ISIS 11539 (fully 2'-O-methyl), ISIS 11541 (having 2'-O-methyl "wings" and a central 7-base "gap"), ISIS 11543 (2'-O-methyl wings with a 9-base gap), ISIS 11545 (having a 5' 2'-O-methyl wing) and ISIS 11547 (having a 3' 2'-O-methyl wing). The results of assays of 2'-O-methyl oligonucleotides were as follows. ISIS 11539, the fully 2'-O-methyl version of ISIS 10996, was not active at all in the protein expression assay. The gapped and winged oligonucleotides (ISIS 11541, 11543, 11545 and 11547) each showed some activity at 200 nM (i.e., from 60 to 70% expression relative to untreated cells), but less than that demonstrated by the parent compound, ISIS 10996 (i.e., about 50% expression). Similar results were seen in RNA expression assays.

ISIS 10782, a derivative of ISIS 10373 to which cholesterol has been conjugated via a 5' n-aminohexyl linker, was prepared. Lipophilic moieties such as cholesterol have been reported to enhance the uptake by cells of oligonucleotides in some instances, although the extent to which uptake is enhanced, if any, remains unpredictable. ISIS 10782, and other oligonucleotides comprising lipophilic moieties, are tested for their ability to modulate B7-2 message or function according to the methods of Examples 3, 4, 7 and 8.

A series of 2'-methoxyethoxy (herein, "2'ME") and 2'-fluoride (herein, "2'F") "gapmer" derivatives of the hB7-1 oligonucleotides ISIS 12361 (ISIS Nos. 12348 and 12473, respectively), ISIS 12362 (ISIS Nos. 12349 and 12474), ISIS 12363 (ISIS Nos. 12350 and 12475), ISIS 12364 (ISIS Nos. 12351 and 12476), ISIS 12365 (ISIS Nos. 12352 and 12477), ISIS 12366 (ISIS Nos. 12353 and 12478), ISIS 12367 (ISIS Nos. 12354 and 12479), ISIS 12368 (ISIS Nos. 12355 and 12480), ISIS 12369 (ISIS Nos. 12356 and 12481) and ISIS 12370 (ISIS Nos. 12357 and 12482) were prepared. The

-65-

central, non-2'-modified portions ("gaps") of these derivatives support RNase H activity when the oligonucleotide is bound to its target RNA, even though the 2'-modified portions do not. However, the 2'-modified "wings" of these oligonucleotides enhance their affinity to their target RNA molecules (Cook, Chapter 9 *In: Antisense Research and Applications*, Crooke et al., eds., CRC Press, Boca Raton, 1993, pp. 171-172).

Another 2' modification is the introduction of a methoxy (MO) group at this position. Like 2'ME- and 2'F-modified oligonucleotides, this modification prevents the action of RNase H on duplexes formed from such oligonucleotides and their target RNA molecules, but enhances the affinity of an oligonucleotide for its target RNA molecule. ISIS 12914 and 12915 comprise sequences complementary to the 5' untranslated region of alternative hB7-1 mRNA molecules, which arise from alternative splicing events of the primary hB7-1 transcript. These oligonucleotides include 2' methoxy modifications, and the enhanced target affinity resulting therefrom may allow for greater activity against alternatively spliced B7-1 mRNA molecules which may be present in low abundance in some tissues (Inobe et al., *J. Immun.*, 1996, 157, 582). Similarly, ISIS 13498 and 13499, which comprise antisense sequences to other alternative hB7-1 mRNAs, include 2' methoxyethoxy modifications in order to enhance their affinity for their target molecules, and 2' methoxyethoxy or 2'methoxy substitutions are incorporated into the hB7-2 oligonucleotides ISIS 12912, 12913, 13496 and 13497. These oligonucleotides are tested for their ability to modulate hB7-1 essentially according to the methods of Example 2 or hB7-2 according to the methods of Examples 3, 4, 7 and 8, with the exception that, when necessary, the target cells

-66-

are transfected with a cDNA clone corresponding to the appropriate alternatively spliced B7 transcript.

Example 6: Specificity of Antisense Modulation

Several oligonucleotides of the invention were
5 evaluated in a cell surface expression flow cytometry assay to determine the specificity of the oligonucleotides for B7-1 as contrasted with activity against B7-2. The oligonucleotides tested in this assay included ISIS 13812, an inhibitor of B7-1 expression (Figure 1; Example 2) and
10 ISIS 10373, an inhibitor of B7-2 expression (Figure 3; Example 3). The results of this assay are shown in Figure 5. ISIS 13812 inhibits B7-1 expression with little or no effect on B7-2 expression. As is also seen in Figure 5, ISIS 10373 inhibits B7-2 expression with little or no
15 effect on B7-1 expression. ISIS 13872 (SEQ ID NO: 37, AGT-CCT-ACT-ACC-AGC-CGC-CT), a scrambled control of ISIS 13812, and ISIS 13809 (SEQ ID NO: 51) were included in these assays and demonstrated essentially no activity against either B7-1 or B7-2.

20 **Example 7: Modulation of hB7-2 Expression by Oligonucleotides in Antigen Presenting Cells**

The ability of ISIS 10373 to inhibit expression from the native B7-2 gene in antigen presenting cells (APCs) was evaluated as follows.

25 **Methods:**

Monocytes were cultured and treated with oligonucleotides as follows. For dendritic cells, EDTA-treated blood was layered onto Polymorphprep™ (1.113 g/mL; Nycomed, Oslo, Norway) and sedimented at 500x g for 30
30 minutes at 20°C. Mononuclear cells were harvested from the interface. Cells were washed with PBS, with serum-free RPMI media (Moore et al., N.Y. J. Med., 1968, 68, 2054) and then with RPMI containing 5% fetal bovine serum (FBS). Monocytes were selected by adherence to plastic cell

-67-

culture cell culture dishes for 1 h at 37°C. After adherence, cells were treated with oligonucleotides in serum-free RPMI containing Lipofectin™ (8 µg/mL). After 4 hours, the cells were washed. Then RPMI containing 5% FBS and oligonucleotide was added to cells along with interleukin-4 (IL-4; R&D Systems, Minneapolis, MN) (66 ng/mL) and granulocyte-macrophage colony-stimulating factor (GM-CSF; R&D Systems, Minneapolis, MN) (66 ng/mL) to stimulate differentiation (Romani et al., *J. Exp. Med.*, 1994, 180, 83, 1994). Cells were incubated for 48 hours, after which cell surface expression of various molecules was measured by flow cytometry.

Mononuclear cells isolated from fresh blood were treated with oligonucleotide in the presence of cationic lipid to promote cellular uptake. As a control oligonucleotide, ISIS 2302 (an inhibitor of ICAM-1 expression; SEQ ID NO: 17) was also administered to the cells. Expression of B7-2 protein was measured by flow cytometry according to the methods of Example 2. Monoclonal antibodies not described in the previous Examples included anti-hCD3 (Ancell, Bayport, MN) and anti-HLA-DR (Becton Dickinson, San Jose, CA).

Results:

As shown in Figure 6, ISIS 10373 has a significant inhibitory effect on B7-2 expression with an IC₅₀ of approximately 250 nM. ISIS 10373 had only a slight effect on ICAM-1 expression even at a dose of 1 µM. ISIS 2302 (SEQ ID NO: 17), a control oligonucleotide which has been shown to inhibit ICAM-1 expression, had no effect on B7-2 expression, but significantly decreased ICAM-1 levels with an IC₅₀ of approximately 250 nM. Under similar conditions, ISIS 10373 did not affect the cell surface expression of B7-1, HLA-DR or CD3 as measured by flow cytometry.

-68-

**Example 8: Modulation of T Cell Proliferation by
Oligonucleotides**

The ability of ISIS 2302 and ISIS 10373 to inhibit T cell proliferation was evaluated as follows. Monocytes
5 treated with oligonucleotide and cytokines (as in Example 6) were used as antigen presenting cells in a T cell proliferation assay. The differentiated monocytes were combined with CD4+ T cells from a separate donor. After 48 hours, proliferation was measured by [³H] thymidine
10 incorporation.

Methods:

For T cell proliferation assays, cells were isolated from EDTA-treated whole blood as described above, except that a faster migrating band containing the lymphocytes was
15 harvested from just below the interface. Cells were washed as described in Example 6 after which erythrocytes were removed by NH₄Cl lysis. T cells were purified using a T cell enrichment column (R&D Systems, Minneapolis, MN) essentially according to the manufacturer's directions.
20 CD4+ T cells were further enriched from the entire T cell population by depletion of CD8+ cells with anti-CD8-conjugated magnetic beads (AMAC, Inc., Westbrook, ME) according to the manufacturer's directions. T cells were determined to be >80% CD4+ by flow cytometry using Cy-
25 chrome-conjugated anti-CD4 mAb (PharMingen, San Diego, CA).

Antigen presenting cells (APCs) were isolated as described in Example 6 and treated with mitomycin C (25 µg/mL) for 1 hour then washed 3 times with PBS. APCs (10⁵ cells) were then combined with 4 x 10⁴ CD4+ T cells in 350
30 µL of culture media. Where indicated, purified CD3 mAb was also added at a concentration of 1 µg/mL. During the last 6 hours of the 48 hour incubation period, proliferation was measured by determining uptake of 1.5 uCi of [³H]-thymidine

-69-

per well. The cells were harvested onto filters and the radioactivity measured by scintillation counting.

Results:

As shown in Figure 7, mononuclear cells which were not
5 cytokine-treated slightly induced T cell proliferation,
presumably due to low levels of costimulatory molecules
expressed on the cells. However, when the cells were
treated with cytokines and induced to differentiate to
dendritic-like cells, expression of both ICAM-1 and B7-2
10 was strongly upregulated. This resulted in a strong T cell
proliferative response which could be blocked with either
anti-ICAM-1 (ISIS 2302) or anti-B7-2 (ISIS 10373)
oligonucleotides prior to induction of the mononuclear
cells. The control oligonucleotide (ISIS 10721) had an
15 insignificant effect on T cell proliferation. A
combination treatment with both the anti-ICAM-1 (ISIS 2302)
and anti-B7-2 (ISIS 10373) oligonucleotides resulted in a
further decrease in T cell response.

Example 9: Modulation of Murine B7 Genes by
20 **Oligonucleotides**

Oligonucleotides (see Table 4) capable of inhibiting
expression of murine B7-2 transiently expressed in COS-7
cells were identified in the following manner. A series of
phosphorothioate oligonucleotides complementary to murine
25 B7-2 (mB7-2) cDNA were screened for their ability to reduce
mB7-2 levels (measured by flow cytometry as in Example 2,
except that a conjugated anti-mB7-2 antibody (i.e., anti-
mCD86-PE, PharMingen, San Diego, CA) in COS-7 cells
transfected with an mB7-2 cDNA clone. Anti-mB7-2 antibody
30 may also be obtained from the hybridoma deposited at the
ATCC under accession No. HB-253. Oligonucleotides (see
Table 2) capable of modulating murine B7-1 expression are
isolated in like fashion, except that a conjugated anti-

-70-

mB7-1 antibody is used in conjunction with COS-7 cells transfected with an mB7-1 cDNA clone.

For murine B7-2, the most active oligonucleotide identified was ISIS 11696 (GGA-TTG-CCA-AGC-CCA-TGG-TG, SEQ ID NO: 18), which is complementary to position 96-115 of the cDNA, a site which includes the translation initiation (AUG) codon. Figure 8 shows a dose-response curve for ISIS 11696 and a scrambled control, ISIS 11866 (CTA-AGT-AGT-GCT-AGC-CGG-GA, SEQ ID NO: 19). ISIS 11696 inhibited cell surface expression of B7-2 in COS-7 cells with an IC_{50} in the range of 200-300 nM, while ISIS 11866 exhibited less than 20% inhibition at the highest concentration tested (1000 nM).

In order to further evaluate the murine B7-2 antisense oligonucleotides, the IC-21 cell line was used. IC-21 monocyte/macrophage cell line expresses both B7-1 and murine B7-2 (mB7-2) constitutively. A 2-fold induction of expression can be achieved by incubating the cells in the presence of lipopolysaccharide (LPS; GIBCO-BRL, Gaithersburg, MD) (Hathcock et al., *Science*, 1993, 262, 905).

IC-21 cells (ATCC; accession No. TIB 186) were seeded at 80% confluency in 12-well plates in DMEM media with 10% FCS. The cells were allowed to adhere to the plate overnight. The following day, the medium was removed and the cells were washed with PBS. Then 500 μ L of OptiMEM™ (GIBCO-BRL, Gaithersburg, MD) supplemented with 15 μ g/mL of Lipofectin™ (GIBCO-BRL, Gaithersburg, MD) was added to each well. Oligonucleotides were then added directly to the medium at the indicated concentrations. After incubation for 4 hours, the cells were washed with PBS and incubated overnight in culture medium supplemented with 15 μ g/mL of LPS. The following day, cells were harvested by scraping,

-71-

then analyzed for cell surface expression by flow cytometry.

ISIS 11696 and ISIS 11866 were administered to IC-21 cells in the presence of Lipofectin™ (GIBCO-BRL, Gaithersburg, MD). The results are shown in Figure 9. At a concentration of 10 uM, ISIS 11696 inhibited mB7-2 expression completely (and decreased mB7-2 levels below the constitutive level of expression), while the scrambled control oligonucleotide, ISIS 11866, produced only a 40% reduction in the level of induced expression. At a concentration of 3 uM, levels of induced expression were greatly reduced by ISIS 11696, while ISIS 11866 had little effect.

Modified oligonucleotides, comprising 2' substitutions (e.g., 2' methoxy, 2' methoxyethoxy) and targeted to alternative transcripts of murine B7-1 (ISIS 12914, 12915, 13498, 13499) or murine B7-2 (ISIS 13100, 13100 and 13102) were prepared. These oligonucleotides are tested for their ability to modulate murine B7 essentially according to the above methods using IC-21 cells or COS-7 transfected with a cDNA clone corresponding to the appropriate alternatively spliced B7 transcript.

Example 10: Modulation of Allograft Rejection by Oligonucleotides

A murine model for evaluating compounds for their ability to inhibit heart allograft rejection has been previously described (Stepkowski et al., *J. Immunol.*, 1994, 153, 5336). This model was used to evaluate the immunosuppressive capacity of antisense oligonucleotides to B7 proteins alone or in combination with antisense oligonucleotides to intercellular adhesion molecule-1 (ICAM-1).

Methods:

Heart allograft rejection studies and oligonucleotide

-72-

treatments of BALB/c mice were performed essentially as previously described (Stepkowski et al., *J. Immunol.*, 1994, 153, 5336). Antisense oligonucleotides used included ISIS 11696, ISIS 3082 (targeted to ICAM-1) and ISIS 1082 (a control oligonucleotide targeted to the herpes virus UL-13 gene sequence). Dosages used were 1, 2, 2.5, 5 or 10 mg/kg of individual oligonucleotide (as indicated below); when combinations of oligonucleotides were administered, each oligonucleotide was given at a dosage of 1, 5 or 10 mg/kg (total oligonucleotide dosages of 2, 10 and 20 mg/kg, respectively). The survival times of the transplanted hearts and their hosts were monitored and recorded.

Results:

The mean survival time for untreated mice was 8.2 ± 0.8 days (7,8,8,8,9,9 days). Treatment of the mice for 7 days with ISIS 1082 (SEQ ID NO: 125, unrelated control oligonucleotide) slightly reduced the mean survival times to 7.1 ± 0.7 days (5 mg/kg/day; 6,7,7,7,8,8) or 7.0 ± 0.8 days (10 mg/kg/day; 6,7,7,8). Treatment of the mice for seven days with the murine B7-2 oligonucleotide ISIS 11696 (SEQ ID NO: 108) increased the mean survival time to 9.3 days at two doses (2 mg/kg/day, 9.3 ± 0.6 days, 9,9,10; 10 mg/kg/day, 9.3 ± 1.3 days, 8,9,9,11). Treatment of mice for seven days with an ICAM-1 oligonucleotide, ISIS 3082, also increased the mean survival of the mice over several doses. Specifically, at 1 mg/kg/day, the mean survival time (MSD) was 11.0 ± 0.0 (11,11,11); at 2.5 mg/kg/day, the MSD was 12.0 ± 2.7 (10,12,13,16); at 5 mg/kg/day, the MSD was 14.1 ± 2.7 (10,12,12,13,16,16,17,17); and, at 10 mg/kg/day, the MSD was 15.3 ± 5.8 (12,12,13,24). Some synergistic effect was seen when the mice were treated for seven days with 1 mg/kg/day each of ISIS 3082 and 11696: the MSD was 13.8 ± 1.0 (13,13,14,15).

-73-

**Example 11: Detection of Nucleic Acids Encoding B7
Proteins**

Oligonucleotides are radiolabeled after synthesis by ³²P-labeling at the 5' end with polynucleotide kinase.

- 5 Sambrook et al., "Molecular Cloning. A Laboratory Manual," Cold Spring Harbor Laboratory Press, 1989, Volume 2, pg. 11.31. Radiolabeled oligonucleotide capable of hybridizing to a nucleic acid encoding a B7 protein is contacted with a tissue or cell sample suspected of B7 protein expression
- 10 under conditions in which specific hybridization can occur, and the sample is washed to remove unbound oligonucleotide. A similar control is maintained wherein the radiolabeled oligonucleotide is contacted with a normal tissue or cell sample under conditions that allow specific hybridization,
- 15 and the sample is washed to remove unbound oligonucleotide. Radioactivity remaining in the samples indicates bound oligonucleotide and is quantitated using a scintillation counter or other routine means. A greater amount of radioactivity remaining in the samples, as compared to
- 20 control tissues or cells, indicates increased expression of a B7 gene, whereas a lesser amount of radioactivity in the samples relative to the controls indicates decreased expression of a B7 gene.

- Radiolabeled oligonucleotides of the invention are
- 25 also useful in autoradiography. A section of tissues suspected of expressing a B7 gene is treated with radiolabeled oligonucleotide and washed as described above, then exposed to photographic emulsion according to standard autoradiography procedures. A control of a normal tissue
- 30 section is also maintained. The emulsion, when developed, yields an image of silver grains over the regions expressing a B7 gene, which is quantitated. The extent of B7 expression is determined by comparison of the silver grains observed with control and test samples.

-74-

Analogous assays for fluorescent detection of expression of a B7 gene use oligonucleotides of the invention which are labeled with fluorescein or other fluorescent tags. Labeled oligonucleotides are synthesized on an automated DNA synthesizer (Applied Biosystems, Foster City, CA) using standard phosphoramidite chemistry. b-Cyanoethyl-diisopropyl phosphoramidites are purchased from Applied Biosystems (Foster City, CA). Fluorescein-labeled amidites are purchased from Glen Research (Sterling, VA).

10 Incubation of oligonucleotide and biological sample is carried out as described above for radiolabeled oligonucleotides except that, instead of a scintillation counter, a fluorescence microscope is used to detect the fluorescence. A greater amount of fluorescence in the

15 samples, as compared to control tissues or cells, indicates increased expression of a B7 gene, whereas a lesser amount of fluorescence in the samples relative to the controls indicates decreased expression of a B7 gene.

Example 12: Chimeric (deoxy gapped) Human B7-1 Antisense

20 Oligonucleotides

Additional oligonucleotides targeting human B7-1 were synthesized. Oligonucleotides were synthesized as uniformly phosphorothioate chimeric oligonucleotides having regions of five 2'-O-methoxyethyl (2'-MOE) nucleotides at

25 the wings and a central region of ten deoxynucleotides. Oligonucleotide sequences are shown in Table 6.

Oligonucleotides were screened as described in Example 4. Results are shown in Table 7.

Oligonucleotides 22315 (SEQ ID NO: 128), 22316 (SEQ ID NO: 26), 22317 (SEQ ID NO: 129), 22320 (SEQ ID NO: 132), 22324 (SEQ ID NO: 135), 22325 (SEQ ID NO: 136), 22334 (SEQ ID NO: 145), 22335 (SEQ ID NO: 146), 22337 (SEQ ID NO: 148), and 22338 (SEQ ID NO: 36) resulted in 50% or greater inhibition of B7-1 mRNA in this assay.

Example 16: Effect of B7 Antisense Oligonucleotides on Cell Surface Expression

15 B7 antisense oligonucleotides were tested for their effect on cell surface expression of both B7-1 and B7-2. Cell surface expression was measured as described in Example 2. Experiments were done for both human B7 and mouse B7. Results for human B7 are shown in Table 16. Results for mouse B7 are
20 shown in Table 17.

In both species, B7-1 antisense oligonucleotides were able to specifically reduce the cell surface expression of B7-1. B7-2 antisense oligonucleotides were specific for the B7-2 family member. These oligonucleotides were also specific for
25 their effect on B7-1 and B7-2 mRNA levels.

Dose response experiments were performed on several of the more active human B7-1 antisense oligonucleotides. The oligonucleotides were screened as described in Example 2 except that the concentration of oligonucleotide was varied as shown in Table 18. Results are shown in Table 18.

All antisense oligonucleotides tested showed a dose response effect with inhibition of cell surface expression approximately 60% or greater.

**EXAMPLE 17: Effect of B7-1 Antisense Oligonucleotides in a
5 Murine Model for Rheumatoid Arthritis**

Collagen-induced arthritis (CIA) was used as a murine model for arthritis (Mussener, A., et al., *Clin. Exp. Immunol.*, 1997, 107, 485-493). Female DBA/1LacJ mice (Jackson Laboratories, Bar Harbor, ME) between the ages of
10 6 and 8 weeks were used to assess the activity of B7-1 antisense oligonucleotides.

On day 0, the mice were immunized at the base of the tail with 100 µg of bovine type II collagen which is emulsified in Complete Freund's Adjuvant (CFA). On day 7,
15 a second booster dose of collagen was administered by the same route. On day 14, the mice were injected subcutaneously with 100 µg of LPS. Oligonucleotide was administered intraperitoneally daily (10 mg/kg bolus) starting on day -3 (three days before day 0) and continuing
20 for the duration of the study. Oligonucleotide 17456 (SEQ ID NO. 173) is a fully phosphorothioated analog of 18122.

Weights were recorded weekly. Mice were inspected daily for the onset of CIA. Paw widths are rear ankle widths of affected and unaffected joints were measured
25 three times a week using a constant tension caliper. Limbs were clinically evaluated and graded on a scale from 0-4 (with 4 being the highest).

Results are shown in Table 20. Treatment with B7-1 and B7-2 antisense oligonucleotides was able to reduce the
30 incidence of the disease, but had modest effects on severity. The combination of 17456 (SEQ ID NO. 173) and 11696 (SEQ ID NO. 108) was able to significantly reduce the incidence of the disease and its severity.

-95-

Table 20: Effect of B7 antisense oligonucleotide on CIA

ISIS #(s)	SEQ ID NO	Dose mg/kg	% Inci- dence	Peak day ¹	Severity ²
control		---	70%	6.7 ± 2.9	3.2 ± 1.1
17456 (B7-1)	173	10	50%	12.1 ± 4.6	2.7 ± 1.3
11696 (B7-2)	108	10	37.5%	11.6 ± 4.5	3.4 ± 1.8
17456/11696		10	30%	1.0 ± 0.6	0.7 ± 0.4
18110 (B7-1)	161	10	55.6%	2.0 ± 0.8	2.0 ± 1.3
18089 (B7-2)	211	10	44.4%	6.8 ± 2.2	2.3 ± 1.3
18110/18089		10	60%	11.6 ± 0.7	4.5 ± 1.7

¹Peak day is the day from onset of maximum swelling for each joint measure.

²Severity is the total clinical score divided by the total number of mice in the group.

EXAMPLE 18: Effect of B7-1 Antisense Oligonucleotides in a Murine Model for Multiple Sclerosis

Experimental autoimmune encephalomyelitis (EAE) is a commonly accepted murine model for multiple sclerosis (Myers, K.J., et al., *J. Neuroimmunol.*, 1992, 41, 1-8).

SJL/H, PL/J, (SJLxPL/J)F1, (SJLxBalb/c)F1 and Balb/c female mice between the ages of 6 and 12 weeks are used to test the activity of a B7-1 antisense oligonucleotide.

The mice are immunized in the two rear foot pads and base of the tail with an emulsion consisting of encephalitogenic protein or peptide (according to Myers, K.J., et al., *J. of Immunol.*, 1993, 151, 2252-2260) in Complete Freund's Adjuvant supplemented with heat killed *Mycobacterium tuberculosis*. Two days later, the mice

-96-

receive an intravenous injection of 500 ng Bordatella pertussis toxin and additional adjuvant.

Alternatively, the disease may also be induced by the adoptive transfer of T-cells. T-cells are obtained from
5 the draining of the lymph nodes of mice immunized with encephalitogenic protein or peptide in CFA. The T cells are grown in tissue culture for several days and then injected intravenously into naive syngeneic recipients.

Mice are monitored and scored daily on a 0-5 scale for
10 signals of the disease, including loss of tail muscle tone, wobbly gait, and various degrees of paralysis.

Oligonucleotide 17456 (SEQ ID NO. 173), a fully phosphorothioated analog of 18122, was compared to a saline control and a fully phosphorothioated oligonucleotide of
15 random sequence (Oligonucleotide 17460). Results of this experiment are shown in Figure 11.

As shown in Figure 11, for all doses of oligonucleotide 17456 tested, there is a protective effect, i.e. a reduction of disease severity. At 0.2 mg/kg, this
20 protective effect is greatly reduced after day 20, but at the higher doses tested, the protective effect remains throughout the course of the experiment (day 40). The control oligonucleotide gave results similar to that obtained with the saline control.

25 **EXAMPLE 19: Additional antisense oligonucleotides targeted to human B7-1**

Additional oligonucleotides targeting human B7-1 were synthesized. Oligonucleotides were synthesized as uniformly phosphorothioate chimeric oligonucleotides having
30 regions of five 2'-O-methoxyethyl (2'-MOE) nucleotides at the wings and a central region of ten deoxynucleotides. Oligonucleotide sequences are shown in Table 21.

The human promonocytic leukaemia cell line, THP-1 (American Type Culture Collection, Manassas, VA) was

-97-

maintained in RPMI 1640 growth media supplemented with 10% fetal calf serum (FCS; Life Technologies, Rockville, MD). A total of 1×10^7 cells were electroporated at an oligonucleotide concentration of 10 micromolar in 2 mm

5 cuvettes, using an Electrocell Manipulator 600 instrument (Biotechnologies and Experimental Research, Inc.) employing 200 V, 1000 μ F. Electroporated cells were then transferred to petri dishes and allowed to recover for 16 hrs. Cells were then induced with LPS at a final concentration of 1

10 μ g/ml for 16 hours. RNA was isolated and processed as described in previous examples. Results are shown in Table 22.

Oligonucleotides 113492, 113495, 113498, 113499, 113501, 113502, 113504, 113505, 113507, 113510, 113511,

15 113513 and 113514 (SEQ ID NO: 228, 231, 234, 235, 237, 238, 240, 241, 243, 247, 248, 250 and 251) resulted in 50% or greater inhibition of B7-1 mRNA expression in this assay.

EXAMPLE 20: Additional antisense oligonucleotides targeted
15 to human B7-2.

Additional oligonucleotides targeting human B7-2 were synthesized. Oligonucleotides were synthesized as uniformly phosphorothioate chimeric oligonucleotides having regions of five 2'-O-methoxyethyl (2'-MOE) nucleotides at
20 the wings and a central region of ten deoxynucleotides. Oligonucleotide sequences are shown in Table 23.

The human promonocytic leukaemia cell line, THP-1 (American Type Culture Collection, Manassas, VA) was maintained in RPMI 1640 growth media supplemented with 10%
25 fetal calf serum (FCS; Life Technologies, Rockville, MD). A total of 1×10^7 cells were electroporated at an oligonucleotide concentration of 10 micromolar in 2 mm cuvettes, using an Electrocell Manipulator 600 instrument (Biotechnologies and Experimental Research, Inc.) employing
30 200 V, 1000 μ F. Electroporated cells were then transferred

-101-

to petri dishes and allowed to recover for 16 hrs Cells were then induced with LPS and dibutyryl cAMP (500 μ M) for 16 hours. RNA was isolated and processed as described in previous examples. Results are shown in Table 24.

- 5 Oligonucleotides ISIS 113131, 113132, 113134, 113138, 113142, 113144, 113145, 113146, 113147, 113148, 113149, 113150, 113153, 113155, 113157, 113158, 113159 and 113160 (SEQ ID NO: 256, 257, 259, 263, 267, 269, 270, 271, 272, 273, 274, 275, 278, 280, 282, 283, 284 and 285) resulted in
10 50% or greater inhibition of B7-2 mRNA expression in this assay.

20

¹ Emboldened residues are 2'-methoxyethoxy residues (others are 2'-deoxy-). All 2'-methoxyethyl cytosines and 2'-deoxy cytosines residues are 5-methyl-cytosines; all linkages are phosphorothioate linkages.

25

²For ISIS# 113131 and 113132, co-ordinates are from Genbank Accession No. L25259, locus name "HUMB72A". For remaining

-103-

oligonucleotides, co-ordinates are from Genbank Accession No.U04343, locus name "HSU04343".

EXAMPLE 21: Human skin psoriasis model

Animal models of psoriasis based on xenotransplantation of human skin from psoriatic patients are advantageous because they involve the direct study of affected human tissue. Psoriasis is solely a disease of the skin and consequently, engraftment of human psoriatic skin onto SCID mice allows psoriasis to be created with a high degree of fidelity in mice. One such model is that of Dam et al., *J. Invest. Dermatol.*, 1999, 113, 1082-1089. Briefly, keratome biopsies containing both dermis and epidermis are obtained from either clinically symptomless skin of psoriatic patients, or from psoriatic plaques. The keratomes are transferred to Earle's balanced Salt Solution (GIBCO, Grand Island, NY) supplemented with 400 U penicillin/ml, 400 ug streptomycin/ml, and 4 mg gentamicin/ml, and stored at 4°C. Immediately before orthotopic transplantation onto the flank of 6-8 week old anesthetized C.B-17 SCID mice (Taconic Farms, Germantown, NY), human skin xenografts (1.7 x 2.2 x 0.05 cm) are cut from the keratomes, and the grafts are secured to each SCID

-105-

mouse with absorbable sutures and covered with dressings for 1 wk. Animals are randomized into treatment groups and test compound (in this case the human B7-1 oligonucleotide ISIS 113492 or the human B7-2 oligonucleotide ISIS 113131, 5 or a combination of both oligonucleotides) is injected intradermally into the xenografts using a 30G needle. Within 3-4 weeks the animals are sacrificed and 4 mm punch biopsies are taken from each xenograft. Biopsies are fixed in formalin for paraffin embedding and/or transferred to 10 cryotubes and snap-frozen in liquid nitrogen and stored at -80°C.

-106-

What is claimed is:

1. A compound comprising 8 to 30 nucleotides connected by covalent linkages, wherein said oligonucleotide has a sequence specifically hybridizable
5 with a nucleic acid encoding a B7 protein and said compound modulates the expression of said B7 protein.
2. The compound of claim 1 which is an antisense oligonucleotide.
3. The compound of claim 1, wherein at least one of
10 said covalent linkages is a modified covalent linkage.
4. The compound of claim 1, wherein at least one of said nucleotides has a modified sugar moiety.
5. The compound of claim 4, wherein said modified sugar moiety is a modification at the 2' position of any
15 nucleotide, the 3' position of the 3' terminal nucleotide or the 5' position of the 5' terminal oligonucleotide.
6. The compound of claim 1, wherein at least one of said nucleotides has a modified nucleobase.
7. The compound of claim 1 wherein said
20 oligonucleotide comprises at least one lipophilic moiety which enhances the cellular uptake of said oligonucleotide.
8. The compound of claim 1 wherein said B7 protein is human B7-1.
9. The compound of claim 8 wherein said sequence
25 comprises SEQ ID NO: 228, 231, 234, 235, 237, 238, 240, 241, 243, 247, 248, 250 or 251.
10. The compound of claim 1 wherein said B7 protein is human B7-2.
11. The compound of claim 10 wherein said sequence
30 comprises SEQ ID NO: 256, 257, 259, 263, 267, 269, 270, 271, 272, 273, 274, 275, 278, 280, 282, 283, 284 or 285.

-107-

12. A composition comprising the compound of claim 1 and a pharmaceutically acceptable carrier.

13. The composition of claim 12 further comprising an anti-inflammatory or immunosuppressive agent.

5 14. A composition comprising
 (a) the compound of claim 8;
 (b) the compound of claim 10 and
 (c) a pharmaceutically acceptable carrier.

10 15. The composition of claim 14 further comprising an anti-inflammatory or immunosuppressive agent.

16. A method of modulating the expression of a B7 protein in cells or tissues comprising contacting said cells or tissues with a compound of claim 1.

15 17. The method of claim 16 wherein said cells or tissues are antigen presenting cells.

18. A method of treating an inflammatory or autoimmune disease or condition in an animal comprising administering to said animal a therapeutically effective amount of a compound of claim 1.

20 19. The method of claim 18 wherein said inflammatory or autoimmune disease or condition is psoriasis, rheumatoid arthritis or multiple sclerosis.

25 20. A method of treating an inflammatory or autoimmune disease or condition in an animal comprising administering to said animal a therapeutically effective amount of a composition of claim 12.

21. The method of claim 20 wherein said inflammatory or autoimmune disease or condition is psoriasis, rheumatoid arthritis or multiple sclerosis.

30 22. A method of treating an inflammatory or autoimmune disease or condition in an animal comprising administering to said animal a therapeutically effective amount of a composition of claim 14.

-108-

23. The method of claim 22 wherein said inflammatory or autoimmune disease or condition is psoriasis, rheumatoid arthritis or multiple sclerosis.

24. A method of inhibiting a T cell response in
5 antigen-presenting cells comprising contacting antigen presenting cells with a compound of claim 1.

25. A method of inhibiting allograft rejection in an animal comprising administering to said animal a compound of claim 1.

10 26. A method of inhibiting allograft rejection in an animal comprising administering to an animal an anti-inflammatory or immunosuppressive agent and a compound of claim 1.

27. A method of inhibiting allograft rejection in an
15 animal comprising administering to the animal the composition of claim 12.

28. The method of claim 27 further comprising administering to the animal an anti-inflammatory or immunosuppressive agent.

20 29. A method of inhibiting allograft rejection in an animal comprising administering to the animal the composition of claim 14.

30. The method of claim 29 further comprising administering to the animal an anti-inflammatory or
25 immunosuppressive agent.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/14471

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : A61K 31/70; C07H 21/00; C12N 5/06

US CL : 435/375; 514/44; 536/24.5

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 435/6, 91.31, 375; 514/44; 536/24.31, 24.5

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
Please See Continuation Sheet

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	US 6,077,833 A (BENNETT et al.) 20 June 2000, see entire document.	1-8, 10, and 12-30
X	US 5,942,607 A (FREEMAN et al.) 24 August 1999, see column 3, line 61, to column 4, line 15; column 14, lines 30-37; and column 17, line 59, to column 18, line 50, especially column 18, lines 34-50.	1, 2, 8, 10, 12, 16-21, 24-28
Y		13-15, 22, 23, 29, and 30
X	US 5,877,021 A (STINCHCOMB et al.) 02 March 1999, see column 5, line 66, to column 6, line 23; column 7, line 26, to column 8, line 60; column 10, line 15 to column 12, line 45; and column 15, lines 36-37.	1-5, 8, 10, and 12-30
Y		6, 7
X	US 5,667,998 A (DOUGHERTY et al.) 16 September 1997, see column 24, line 35, to column 27, line 27.	1, 8, 10, 16, 17, 24, 27
X	WO 96/18736 (RIBOZYME PHARMACEUTICALS) 20 June 1996, see page 19, line 25, to page 20, line 2; page 33, line 10, to page 36, line 16; page 37, line 20, to page 41, line 4; and page 45, line 3, to page 56, line 26.	1-6, 8, 10, and 12-30

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

Special categories of cited documents:	
"A" document defining the general state of the art which is not considered to be of particular relevance	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"E" earlier application or patent published on or after the international filing date	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"O" document referring to an oral disclosure, use, exhibition or other means	"&" document member of the same patent family
"P" document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

20 July 2000 (20.07.2000)

Date of mailing of the international search report

14 AUG 2000

Name and mailing address of the ISA/US

Commissioner of Patents and Trademarks

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/14471

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claim Nos.: 9 and 11
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Please See Continuation Sheet
3. ☐ Claim Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐
☐

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/14471

Continuation of Box A Reason 2: because the computer readable format of the sequence listing for this application is defective. Claims 9 and 11 recite specific SEQ. ID. NOS. that could not be searched other than by a sequence search. Therefore, these claims are unsearchable.

Continuation of B. FIELDS SEARCHED Item 3: USPT, DWPI, EPAB, and JPAB, all using WEST; BIOSIS, CAPLUS, and MEDLINE, all using STN. Search Terms: B7, B7-1, B7-2, antisense, anti sense, ribozyme, oligonucleotide, inflammatory, autoimmune, rheumatoid arthritis, psoriasis, multiple sclerosis
